

Occupant-Centric Grid- Interactive Buildings

10. Calibration

CE 397
Spring 2024

Prof Dr Zoltan Nagy

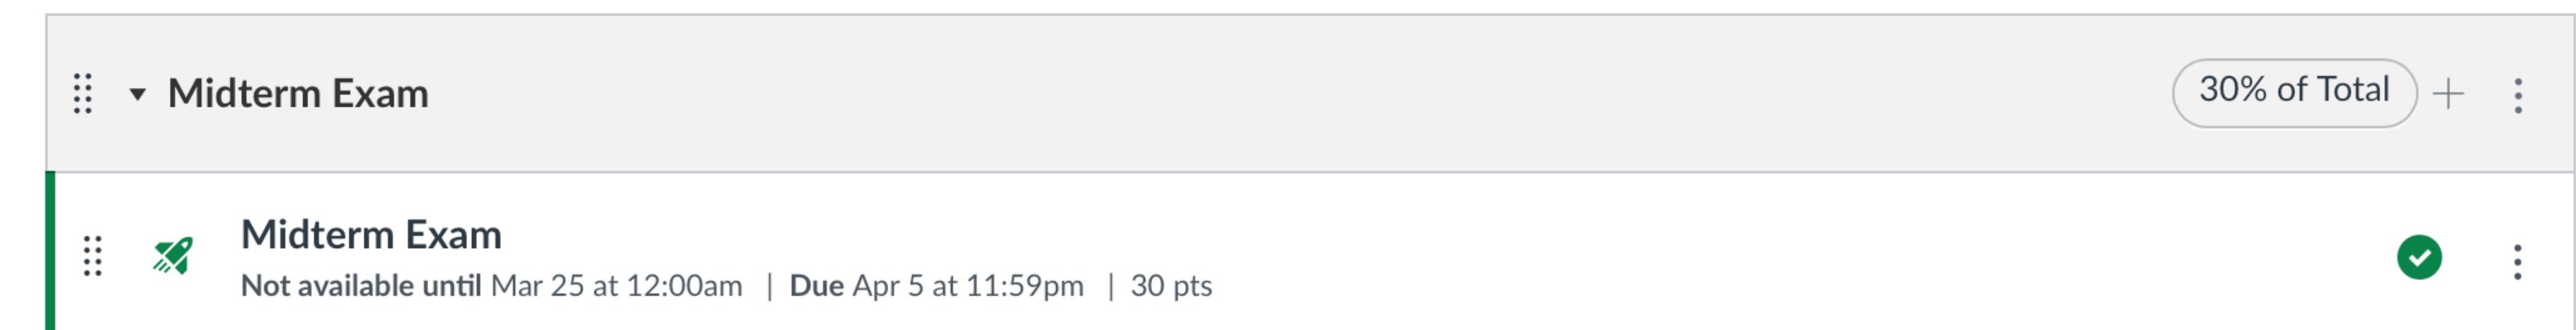

Plan for today

- Midterm reminder
- Project & Rest of the semester outlook
- Quick Recap: Modeling & Control of Buildings
- Main Course: Calibration

- Guest Lecture

Midterm Info

- Quiz on Canvas
- Open March 25
- Due April 5
- No extensions will be given

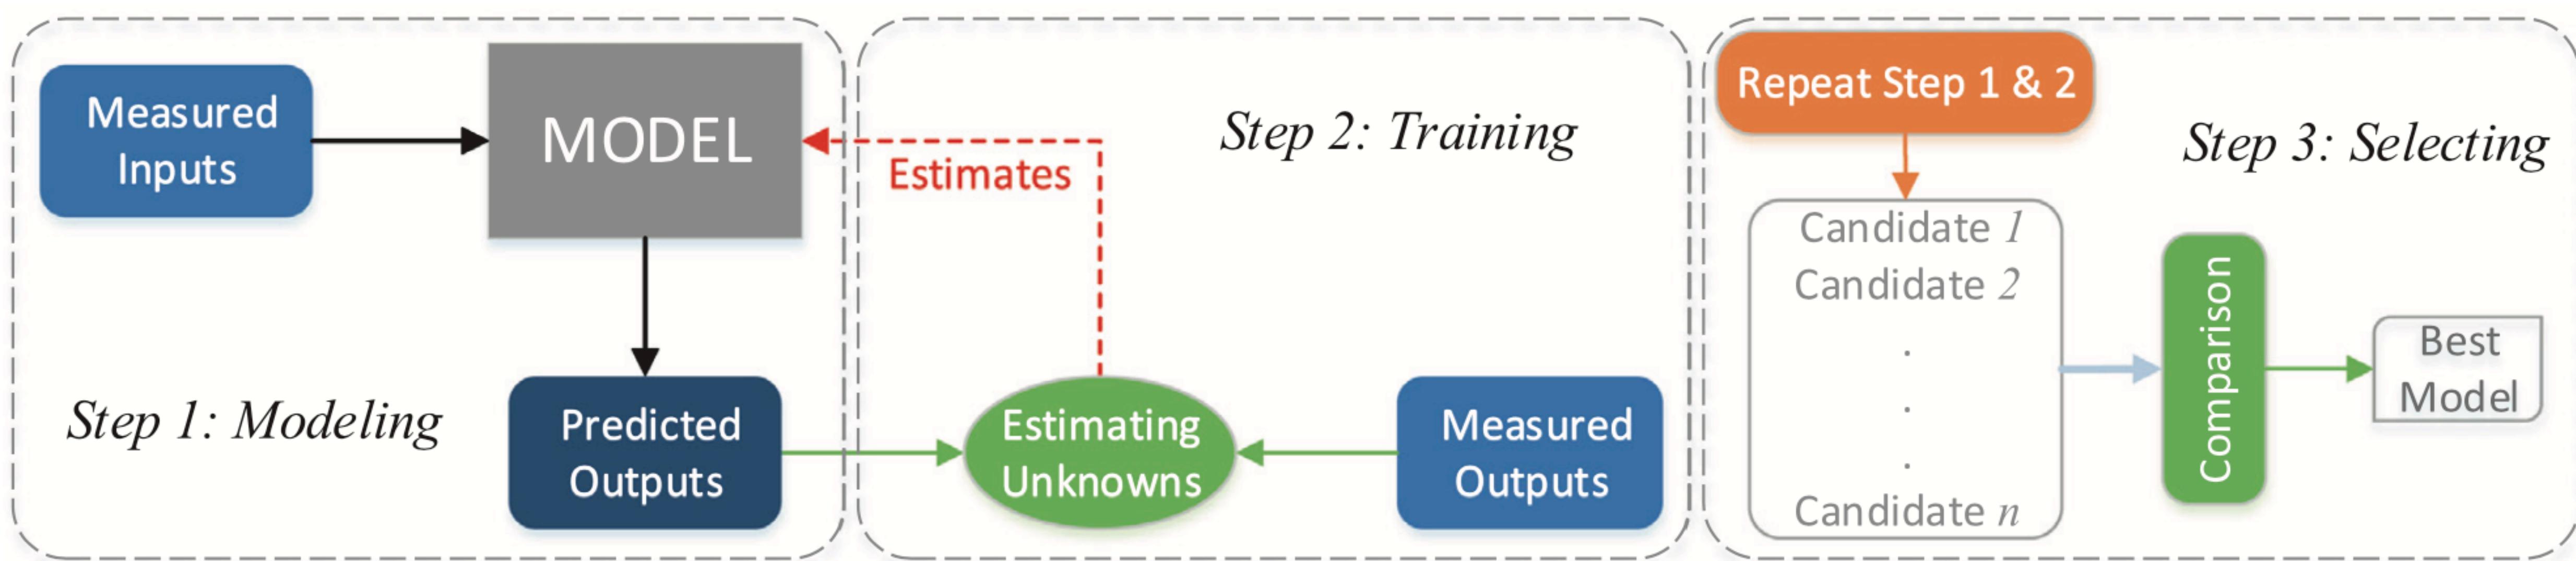

A screenshot of a Canvas course page. At the top, there is a navigation bar with a dropdown menu and a search bar. Below the navigation bar, there is a section titled "Midterm Exam" with a green rocket icon. The section includes the title "Midterm Exam", a note that it is "Not available until Mar 25 at 12:00am | Due Apr 5 at 11:59pm | 30 pts", and a green checkmark icon indicating it is completed. The background of the page is white.

- There are 30 questions. Each question is 1 point.
- You have 60min once you started the exam
- The questions are either on Machine Learning, Building Performance Simulation or Python Programming
- Questions are based on the course material until spring break
- Each question has exactly one correct answer
- You can go back and forth between the questions
- You have only one submission (no resubmissions)
- Questions and answers are shuffled randomly

Tentative Course Outline / Schedule

Week	Class	Topic	Guest Lecture
1	01/17	Introduction / Overview / Python	
2	01/24	Machine Learning I	
3	01/31	Machine Learning II	
4	02/07	Machine Learning III	Justin Hill (Southern)
5	02/14	Occupant Behavior Modeling	
6	02/21	Occupant Behavior Modeling	Tanya Barham (CEL)
7	02/28	Occupant Behavior Modeling	Jessica Granderson (LBNL)
8	03/06	Occupant Behavior Modeling	Hussain Kazmi (KU Leuven)
9	03/13	Spring Break	
10	03/20	Advanced Control & Calibration	Ankush Chakrabarty (MERL)
11	04/27	Calibration	Donghun Kim (LBNL)
12	04/03	Introduction to CityLearn	
13	04/10	Project Work	Siva Sankaranarayanan (EPRI)
14	04/17	Project work	
15	04/24	Project work	

Data-Driven Modeling of building thermal dynamics

1. Modeling: formulate mathematical model(s) with unknown parameters to predict system outputs using measured inputs

2. Training: estimate unknown parameters by matching measured outputs with predicted outputs

3. Selecting: choose best model

Resistor-Capacitor (RC) Models

Table 1
 An example of RC model formulation.

Model structure

Variables

Ordinary differential equations

State-space representation in
 continuous-time

RC network in Fig. 2

Input: $u = [T_o \ \phi_s \ Q_h]'$; Output: $y = T_i$; State: $x = [T_e \ T_i]'$;

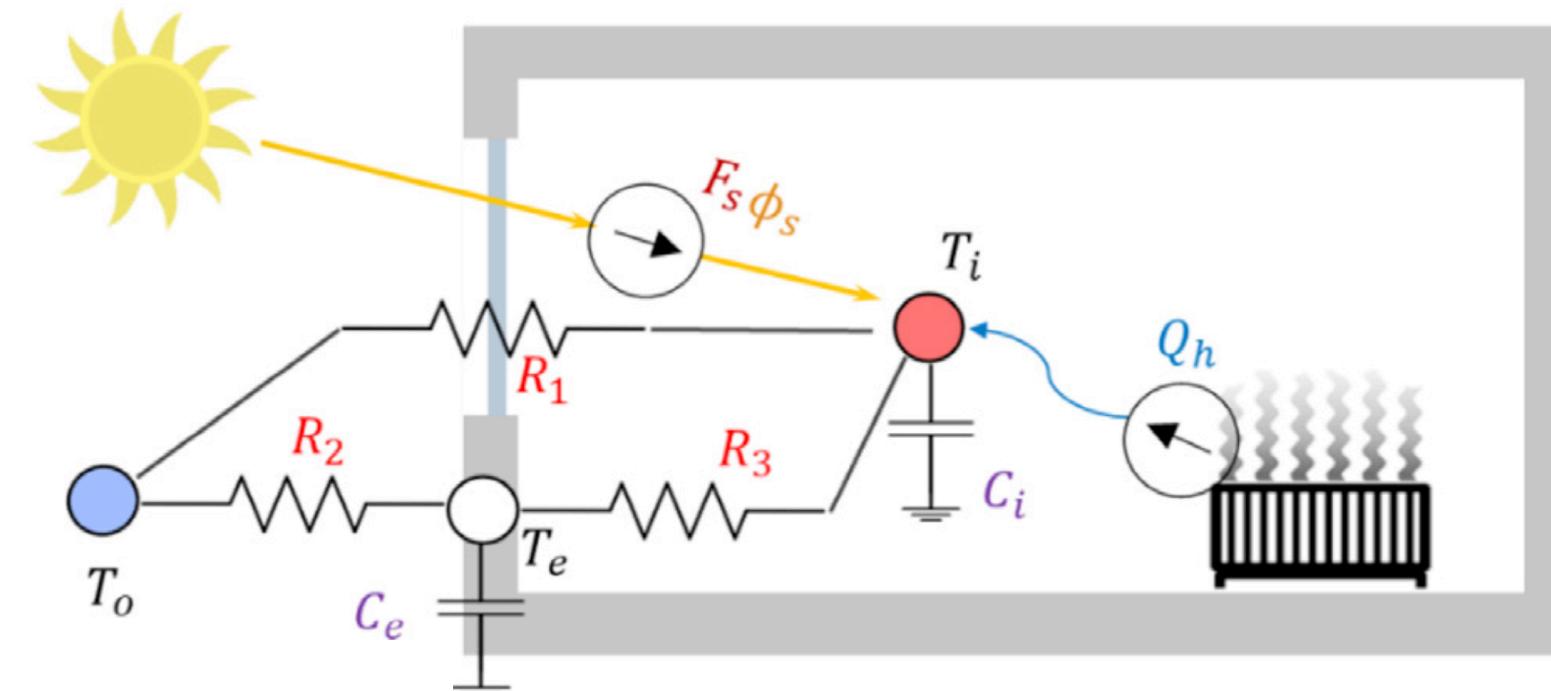

Parameter: $\theta = [R_1 \ R_2 \ R_3 \ C_e \ C_i \ F_s \ F_h]'$

$$C_e \frac{dT_e}{d\tilde{t}} = \frac{T_o - T_e}{R_2} + \frac{T_i - T_e}{R_3}$$

$$C_i \frac{dT_i}{d\tilde{t}} = \frac{T_o - T_i}{R_1} + \frac{T_e - T_i}{R_3} + F_s \phi_s + F_h Q_h \quad (F_h = 1)$$

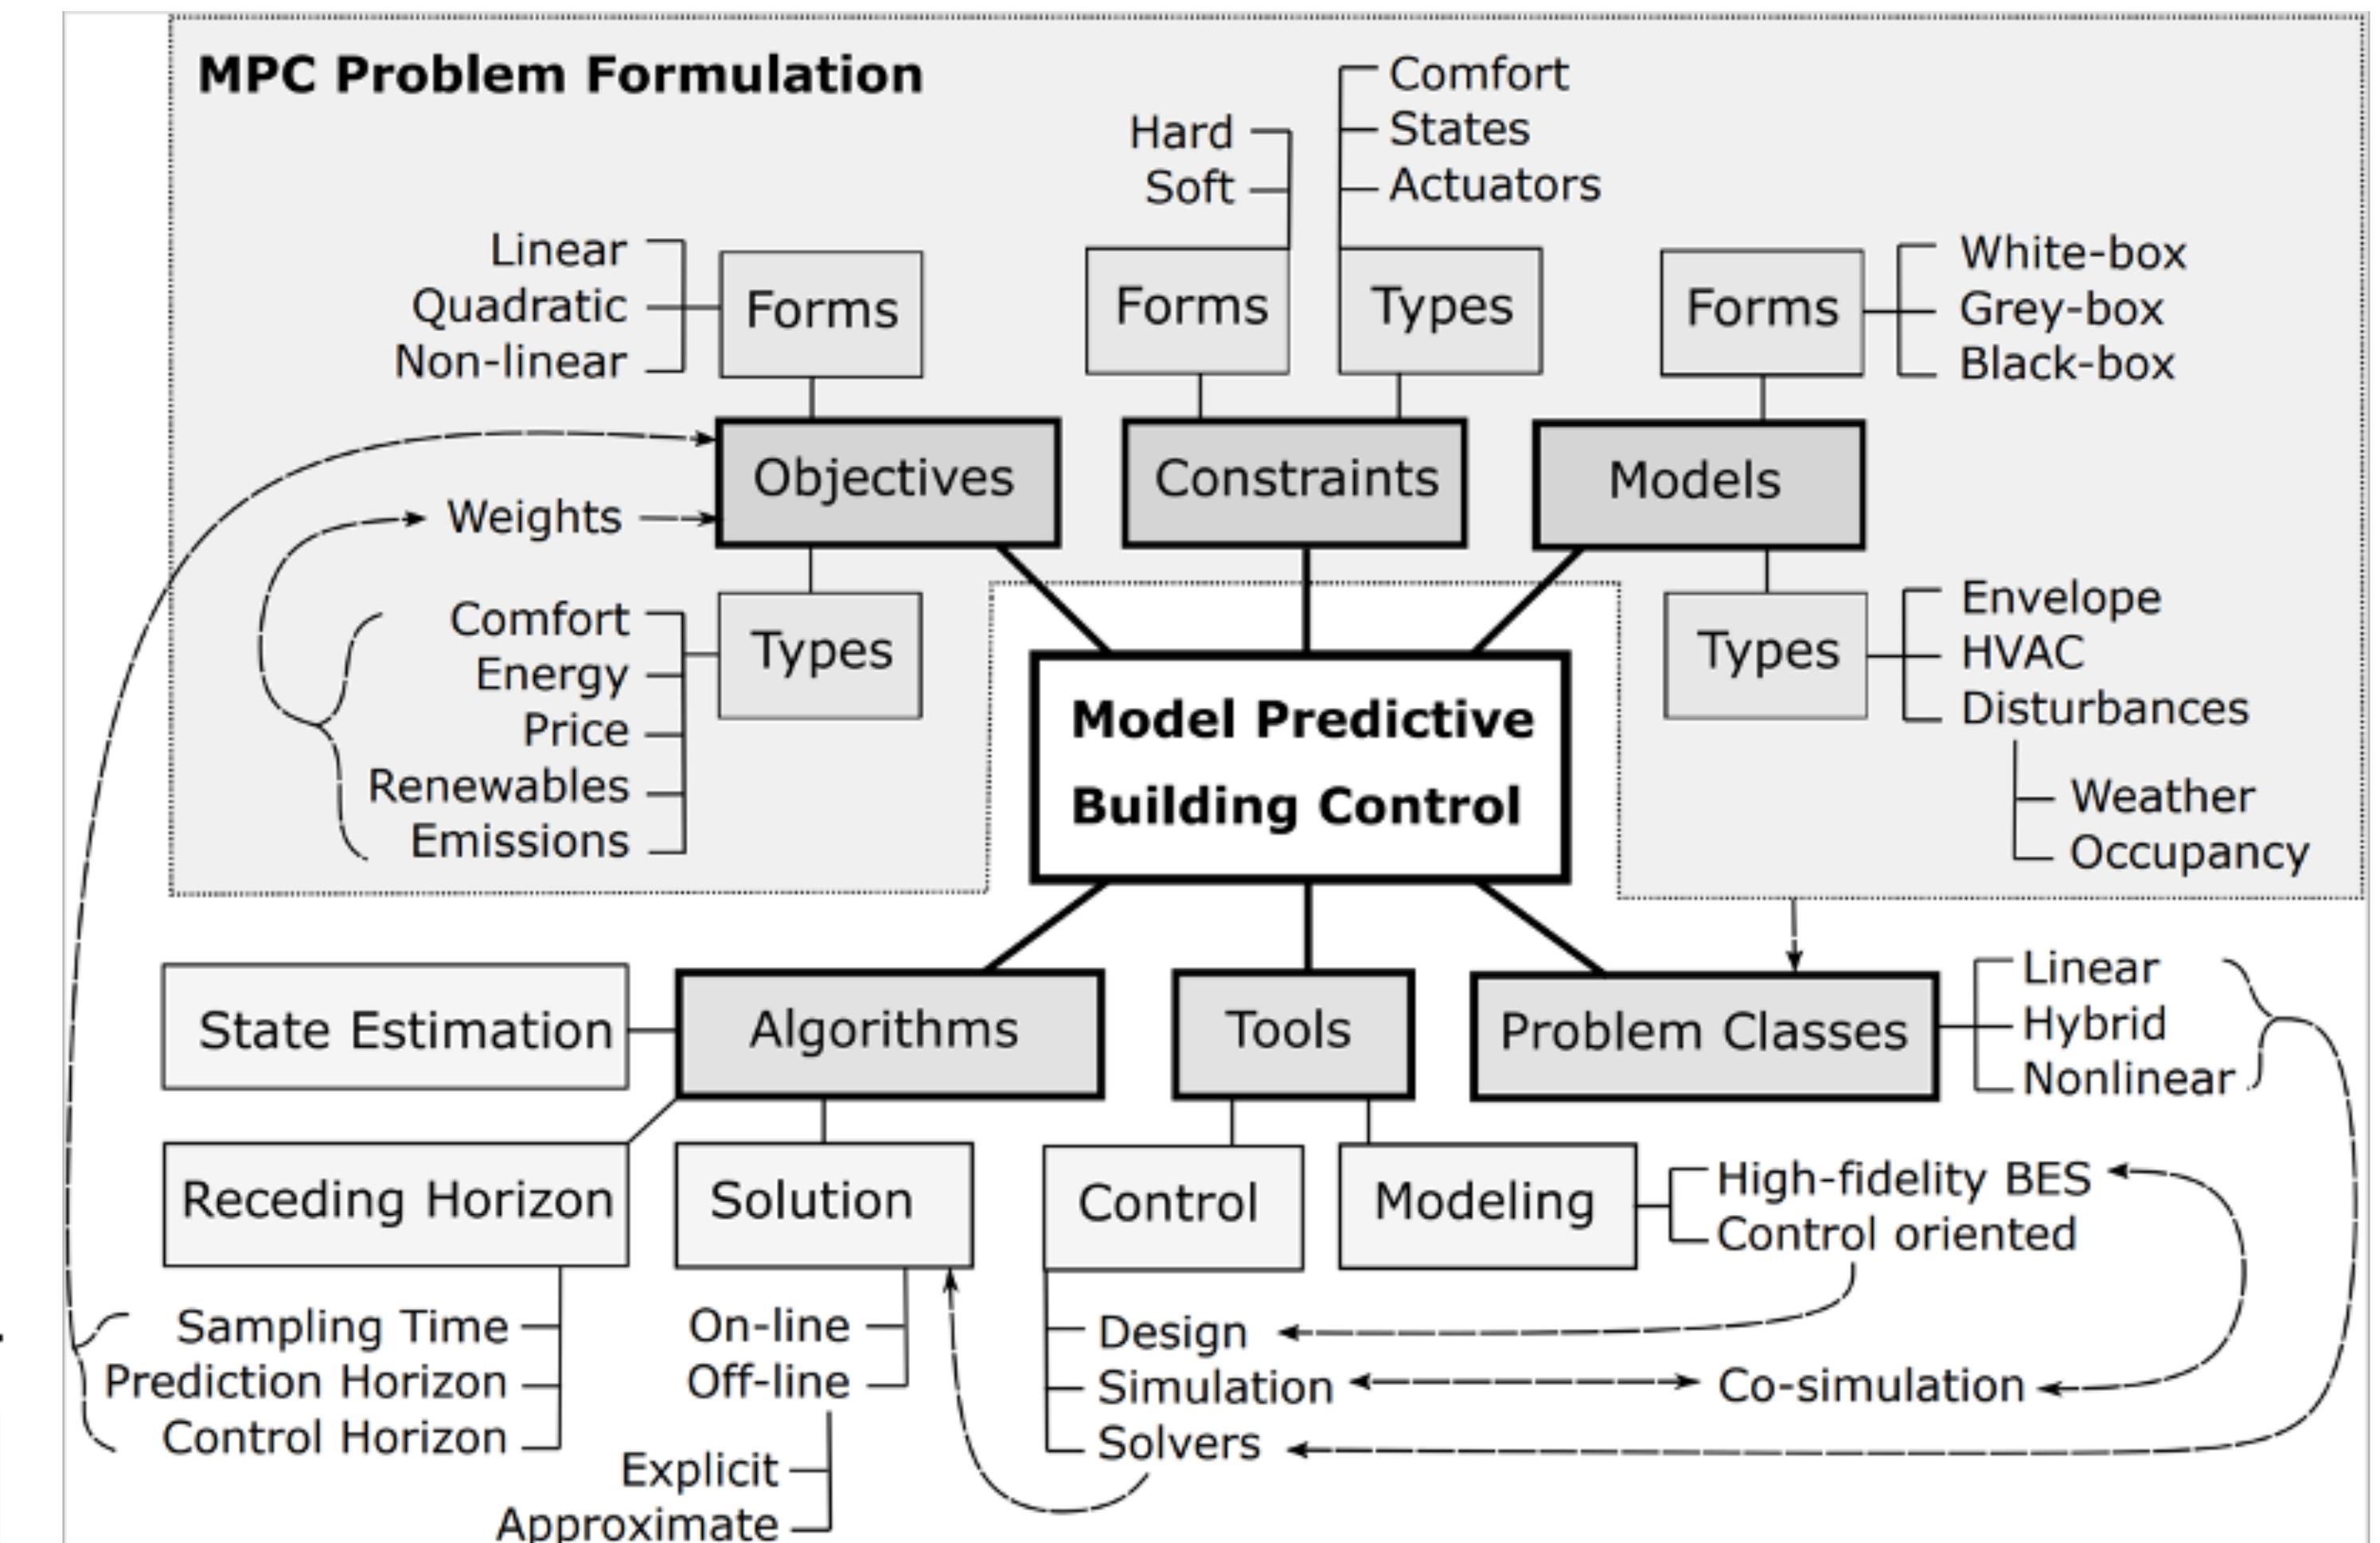

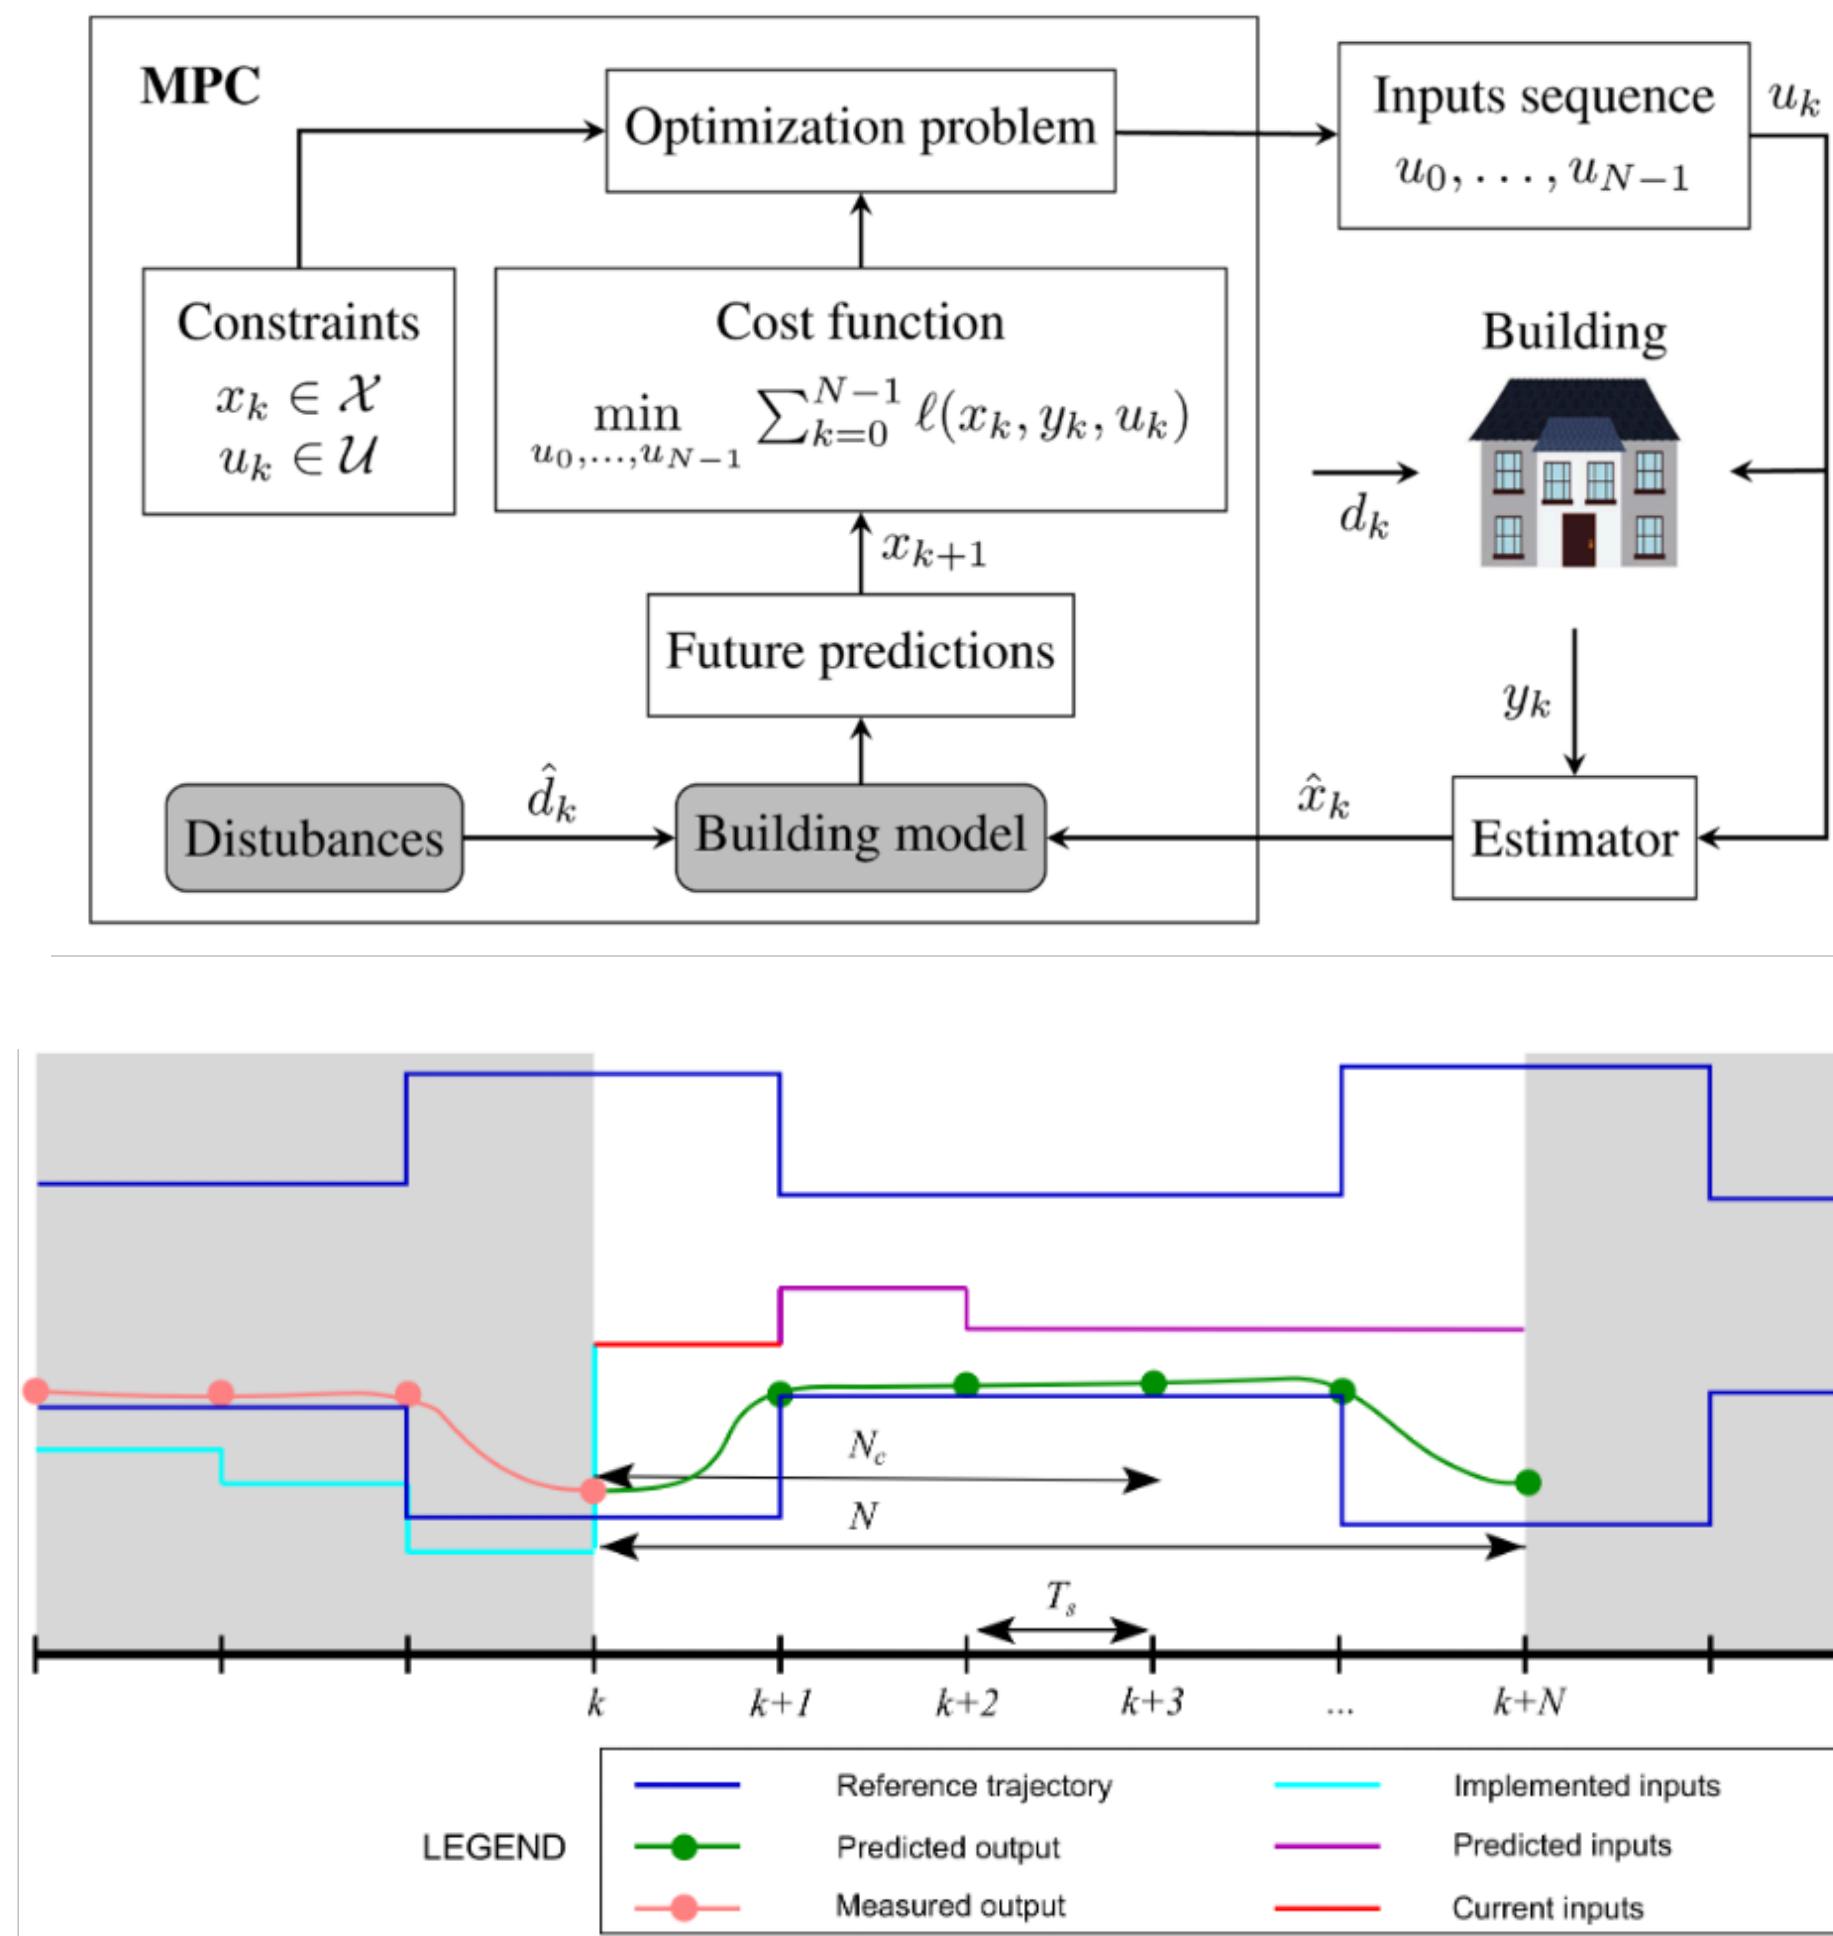

$$\frac{d}{d\tilde{t}} \begin{bmatrix} T_e \\ T_i \end{bmatrix} = \underbrace{\begin{bmatrix} -\frac{1}{C_e R_2} - \frac{1}{C_e R_3} & \frac{1}{C_e R_3} \\ \frac{1}{C_i R_3} & -\frac{1}{C_i R_1} - \frac{1}{C_i R_3} \end{bmatrix}}_{\tilde{A}} \begin{bmatrix} T_e \\ T_i \end{bmatrix} + \underbrace{\begin{bmatrix} \frac{1}{C_e R_2} & 0 & 0 \\ \frac{1}{C_i R_1} & \frac{F_s}{C_i} & \frac{1}{C_i} \end{bmatrix}}_{\tilde{B}} \begin{bmatrix} T_o \\ \phi_s \\ Q_h \end{bmatrix}$$

$$T_i = \underbrace{[0 \ 1]}_{\tilde{C}} \begin{bmatrix} T_e \\ T_i \end{bmatrix} + \underbrace{0 \ 0 \ 0}_{\tilde{D}} \begin{bmatrix} T_o \\ \phi_s \\ Q_h \end{bmatrix}$$

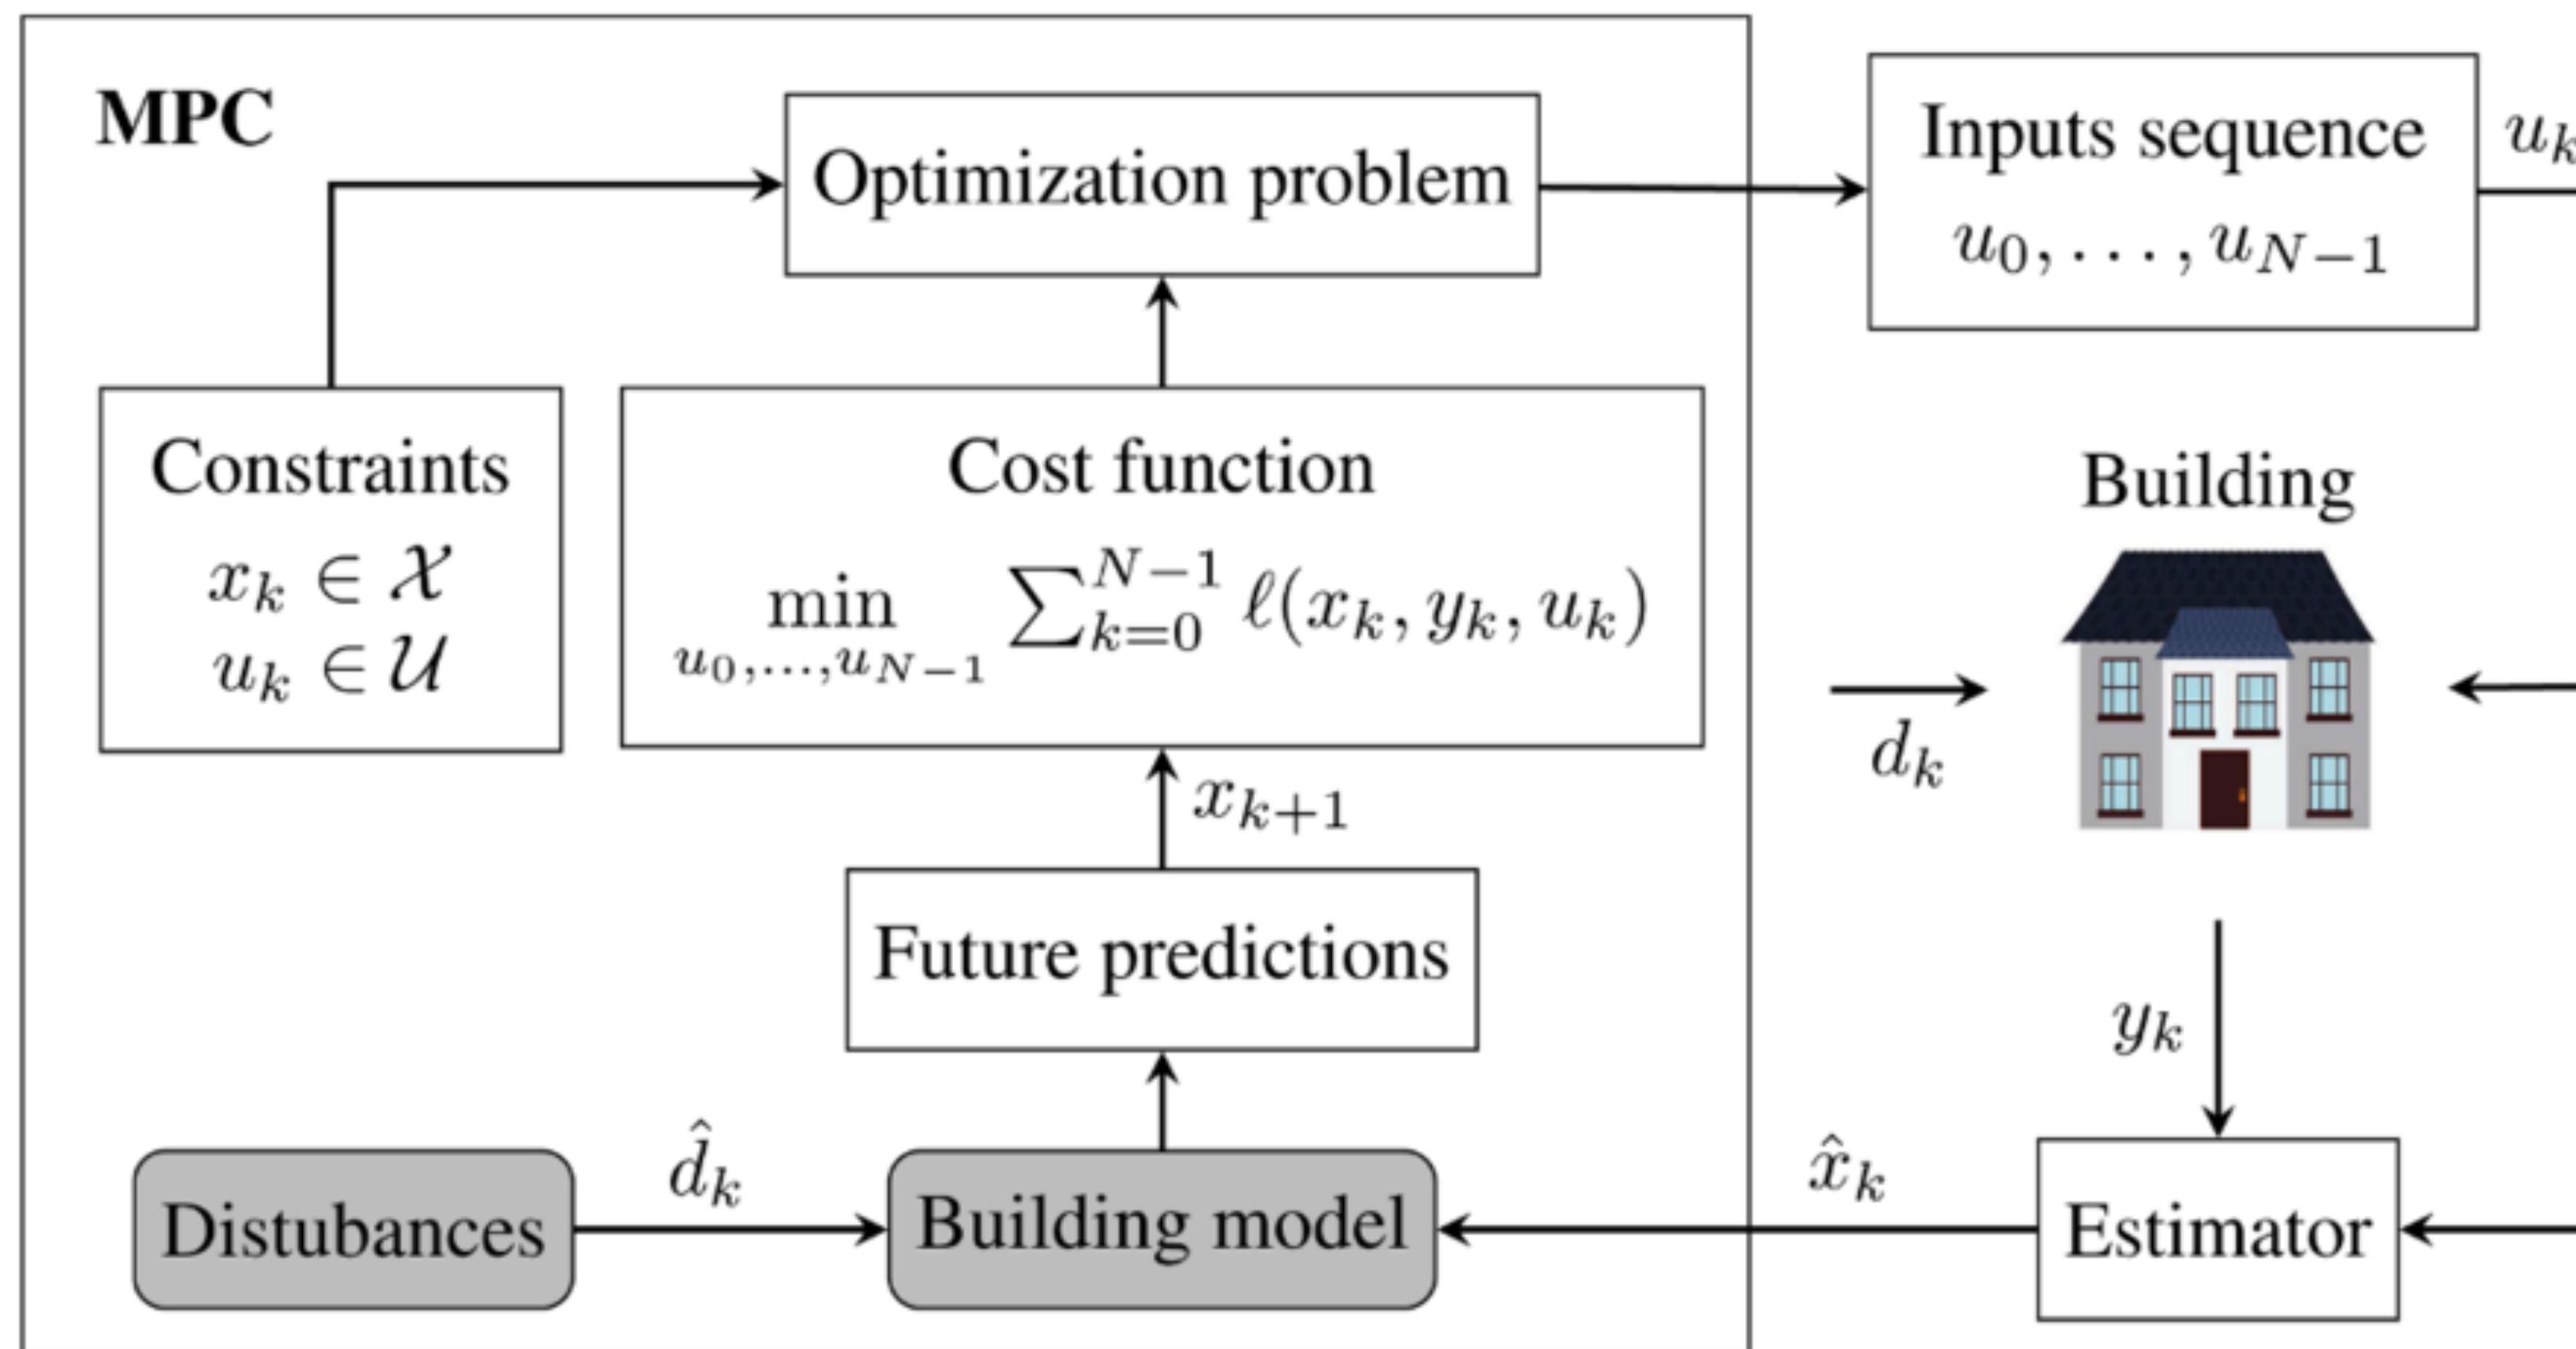

esentation of a room with a RC network (T_i : indoor air temperature; T_e : temperature of building envelop; T_o : outdoor air temperature; ϕ_s : solar radiation on south façade; F_s : a ratio factor).

All you Need to Know About Model Predictive Control

All you Need to Know About Model Predictive Control

$$\begin{aligned}
 & \min_{u_0, \dots, u_{N-1}} \ell_N(x_N) + \sum_{k=0}^{N-1} \ell_k(x_k, y_k, r_k, u_k, s_k) \\
 \text{s.t. } & x_{k+1} = f(x_k, u_k, d_k), k \in \mathbb{N}_0^{N-1} \\
 & y_k = g(x_k, u_k, d_k), k \in \mathbb{N}_0^{N-1} \\
 & u_k = f_{\text{HVAC}}(x_k, a_k, m_k), k \in \mathbb{N}_0^{N-1}
 \end{aligned}$$

What is calibration?

What is calibration?

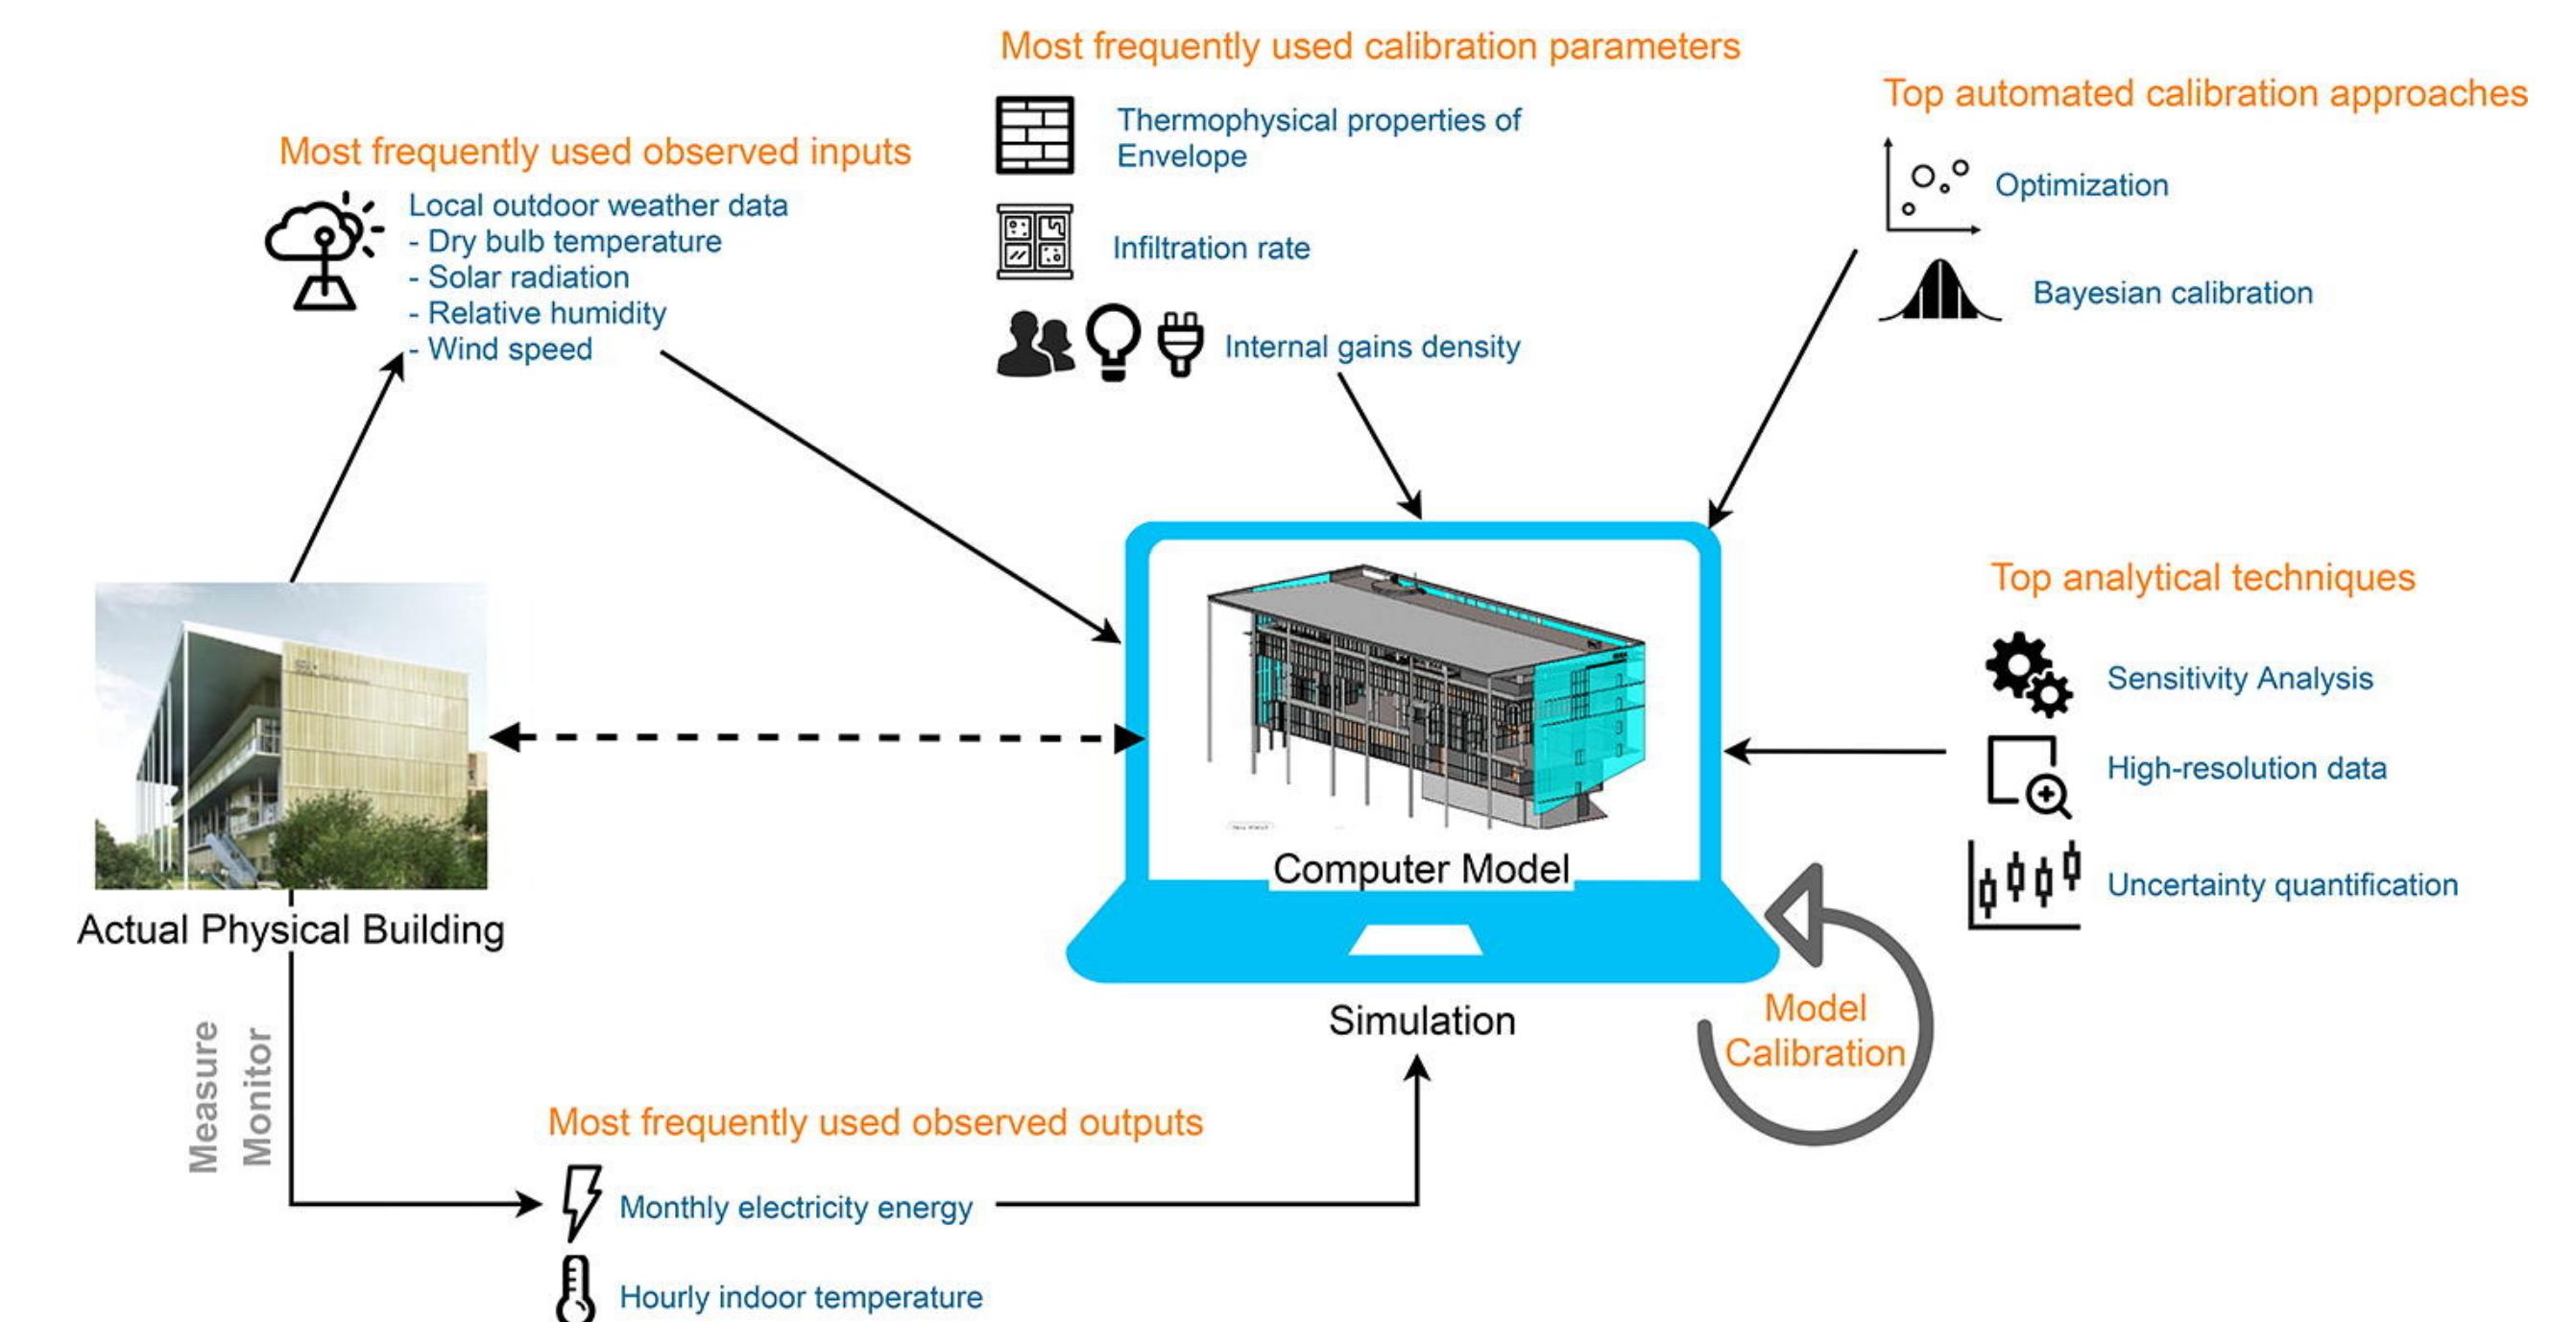

A review of the basics of model calibration to guide future work

What is calibration?

Calibration: The process of adjusting numerical or physical modeling parameters in the computational model for the purpose of improving agreement with experimental data.

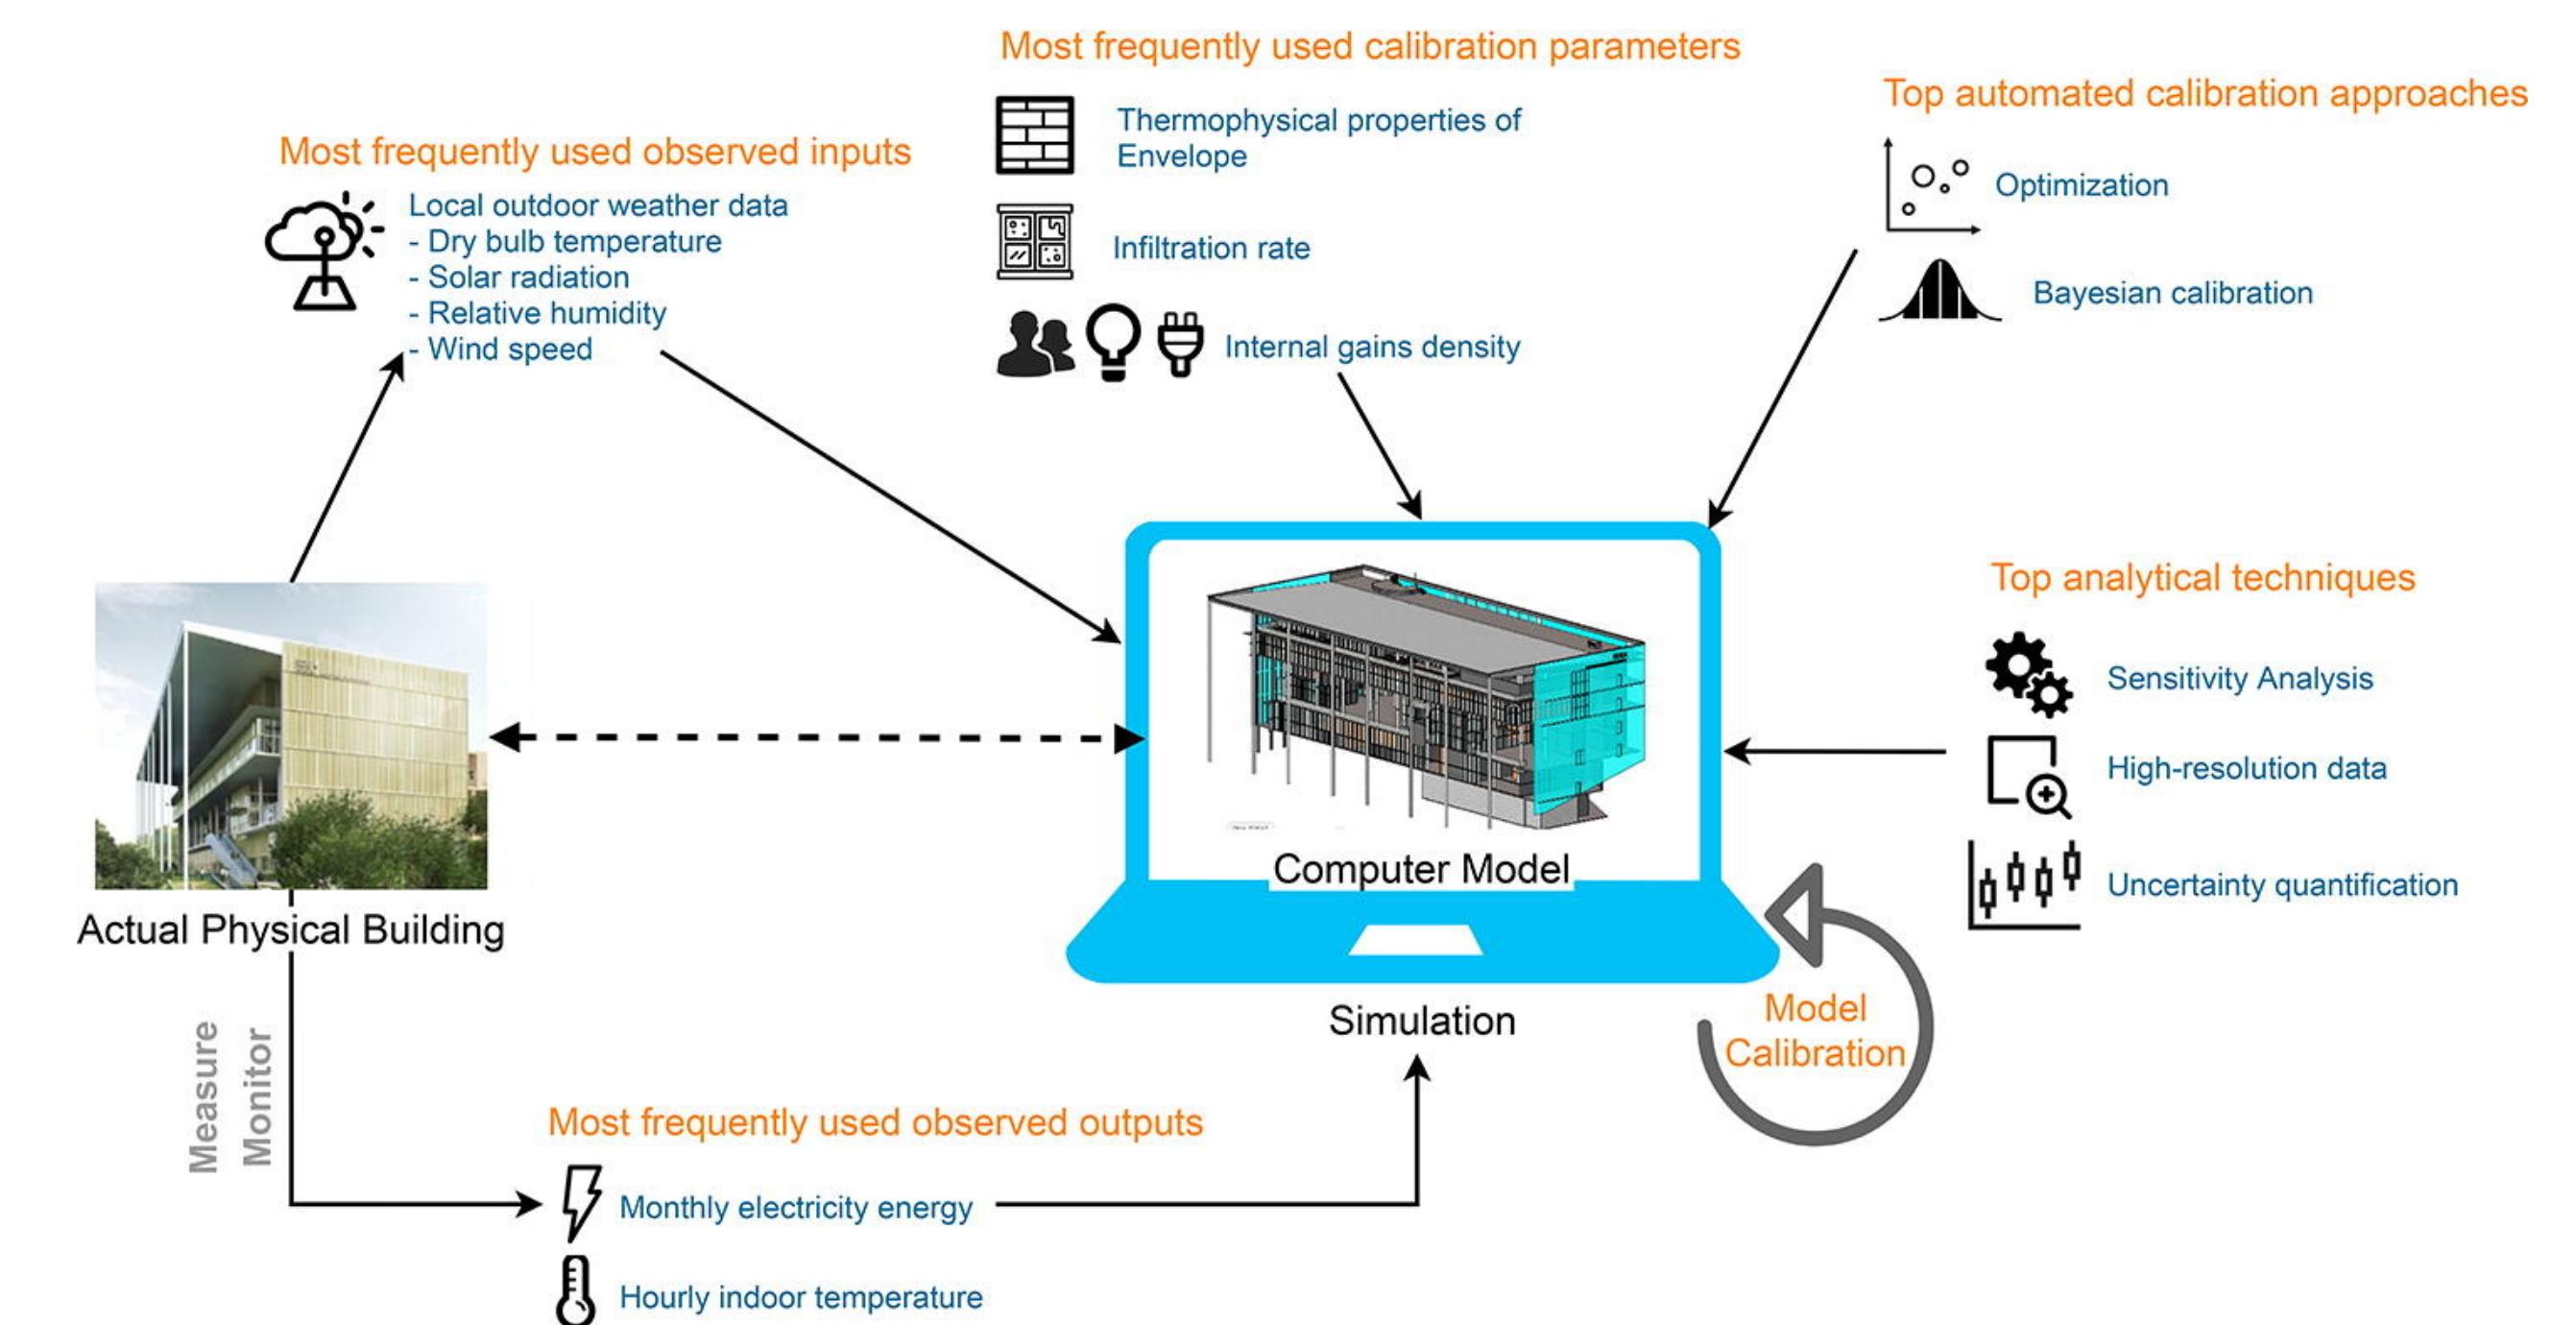

A review of the basics of model calibration to guide future work

What is calibration?

Calibration is not essential for BES research and practice, but it increases the model's credibility.

A review of the basics of model calibration to guide future work

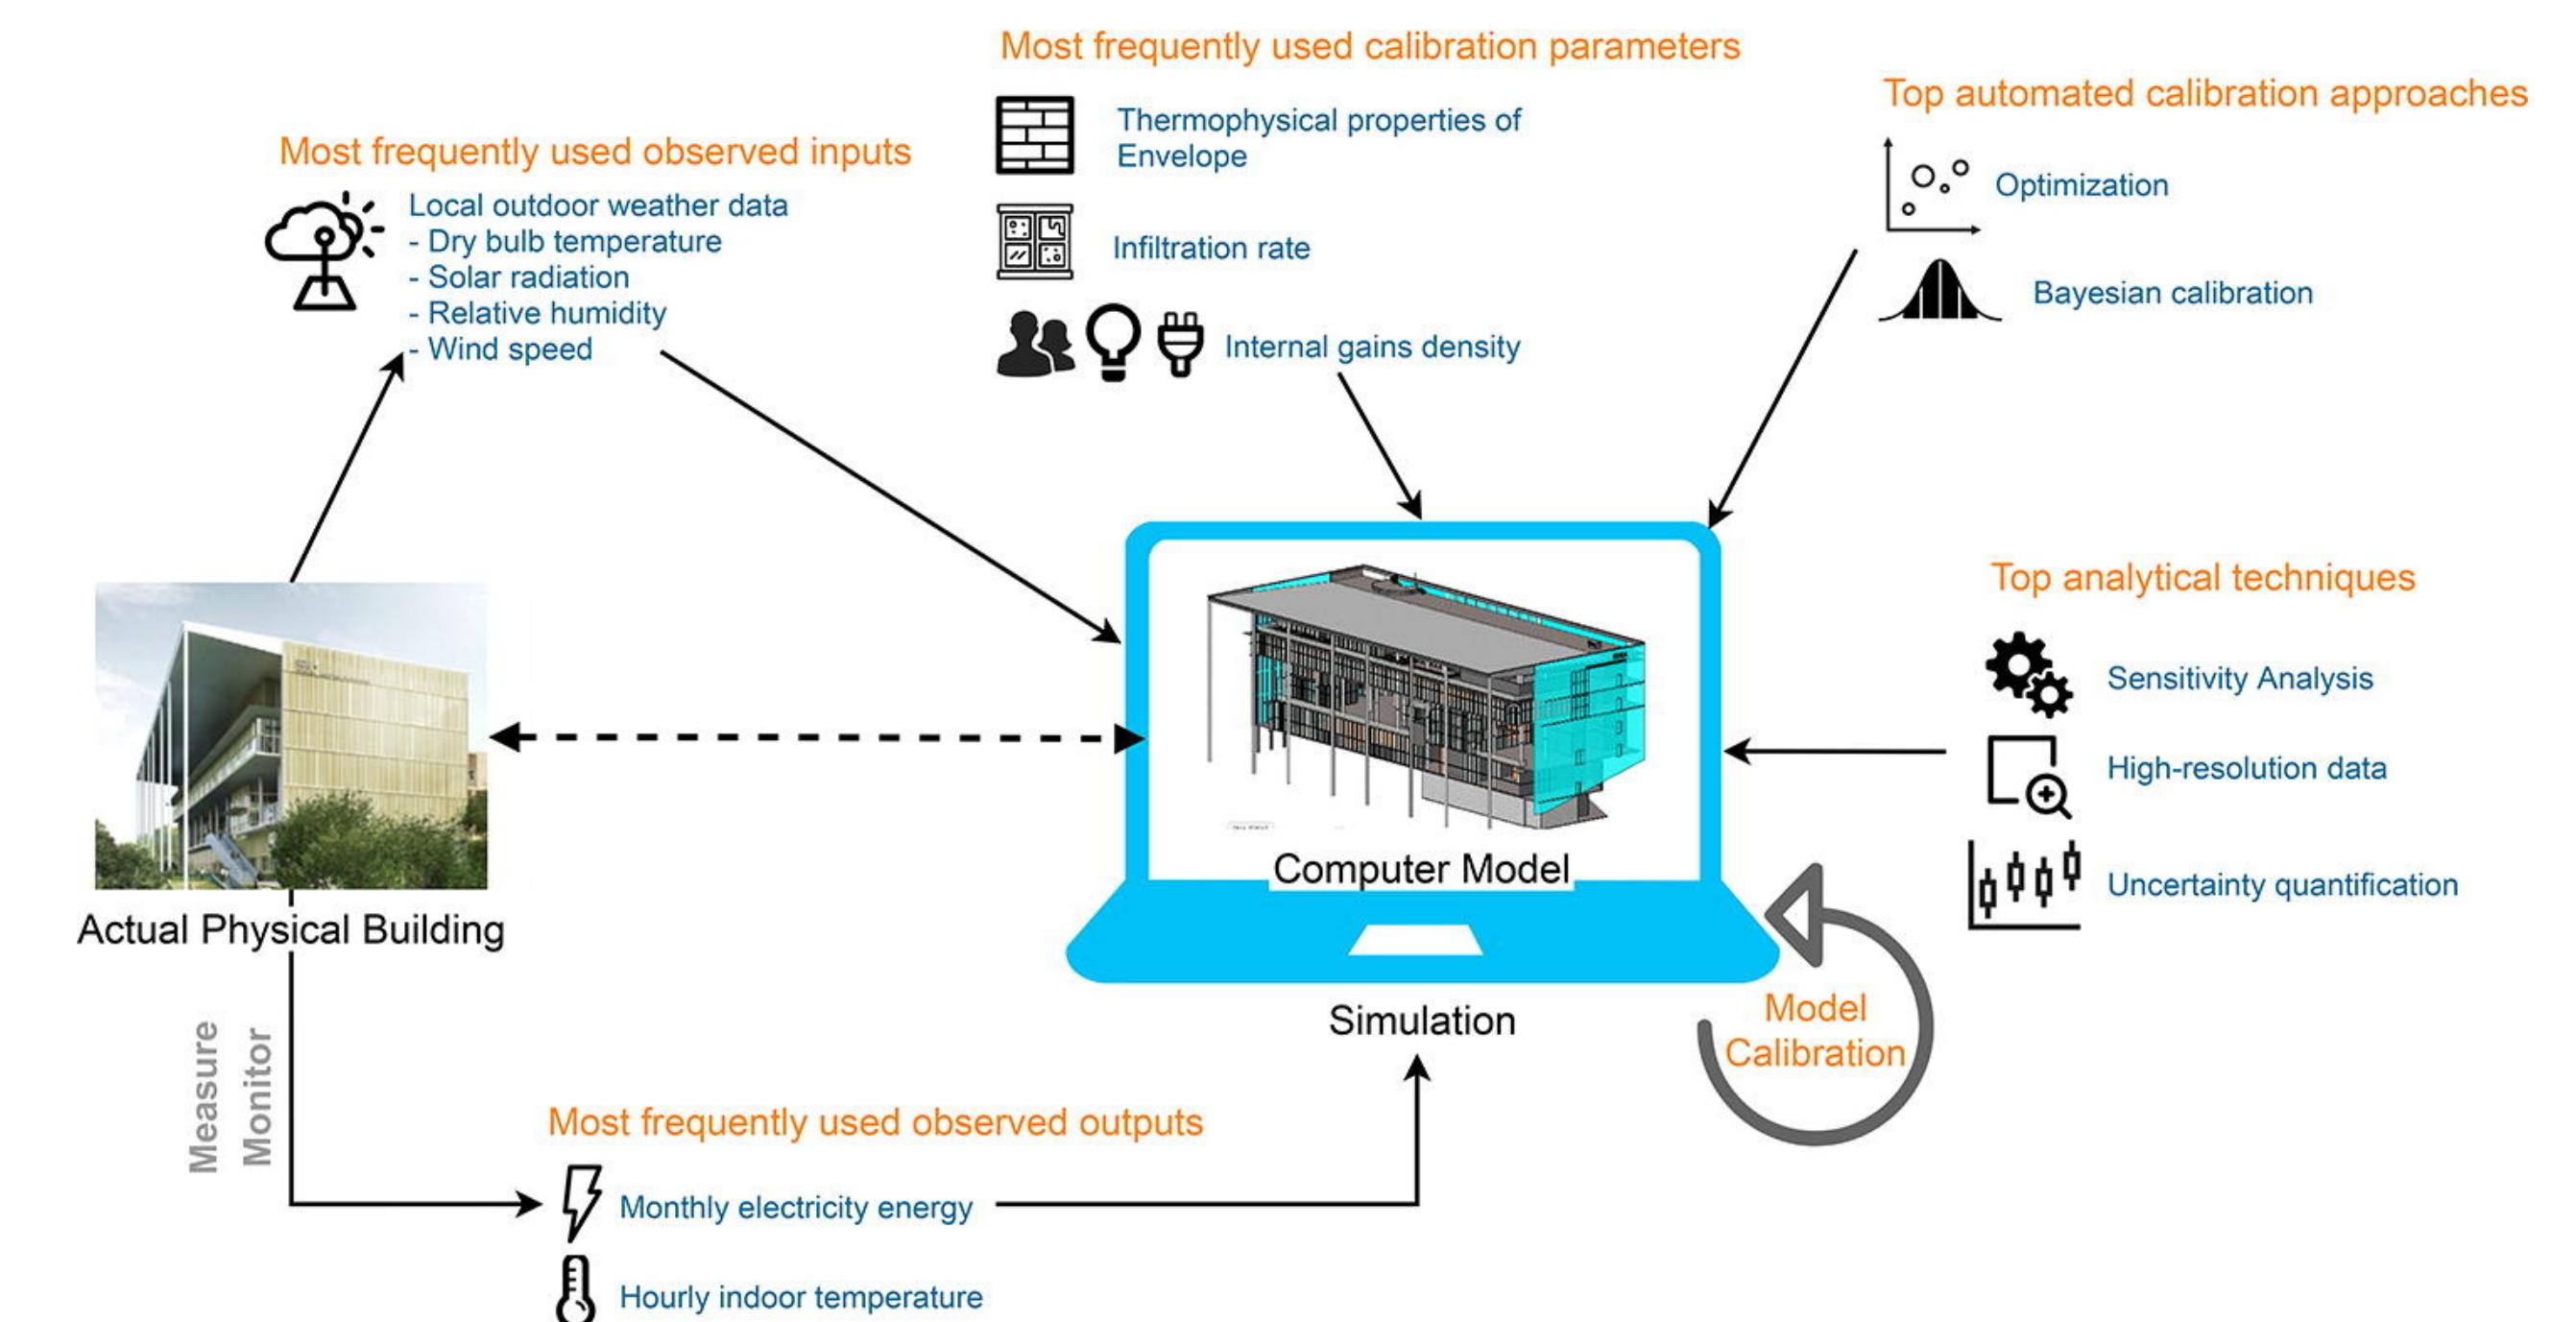

Why Calibration ?

Simulating an experiment without knowledge of its results or prior to its execution.

e.g., retrofit analysis that compares the cost-effectiveness of different energy conservation measures (ECMs).

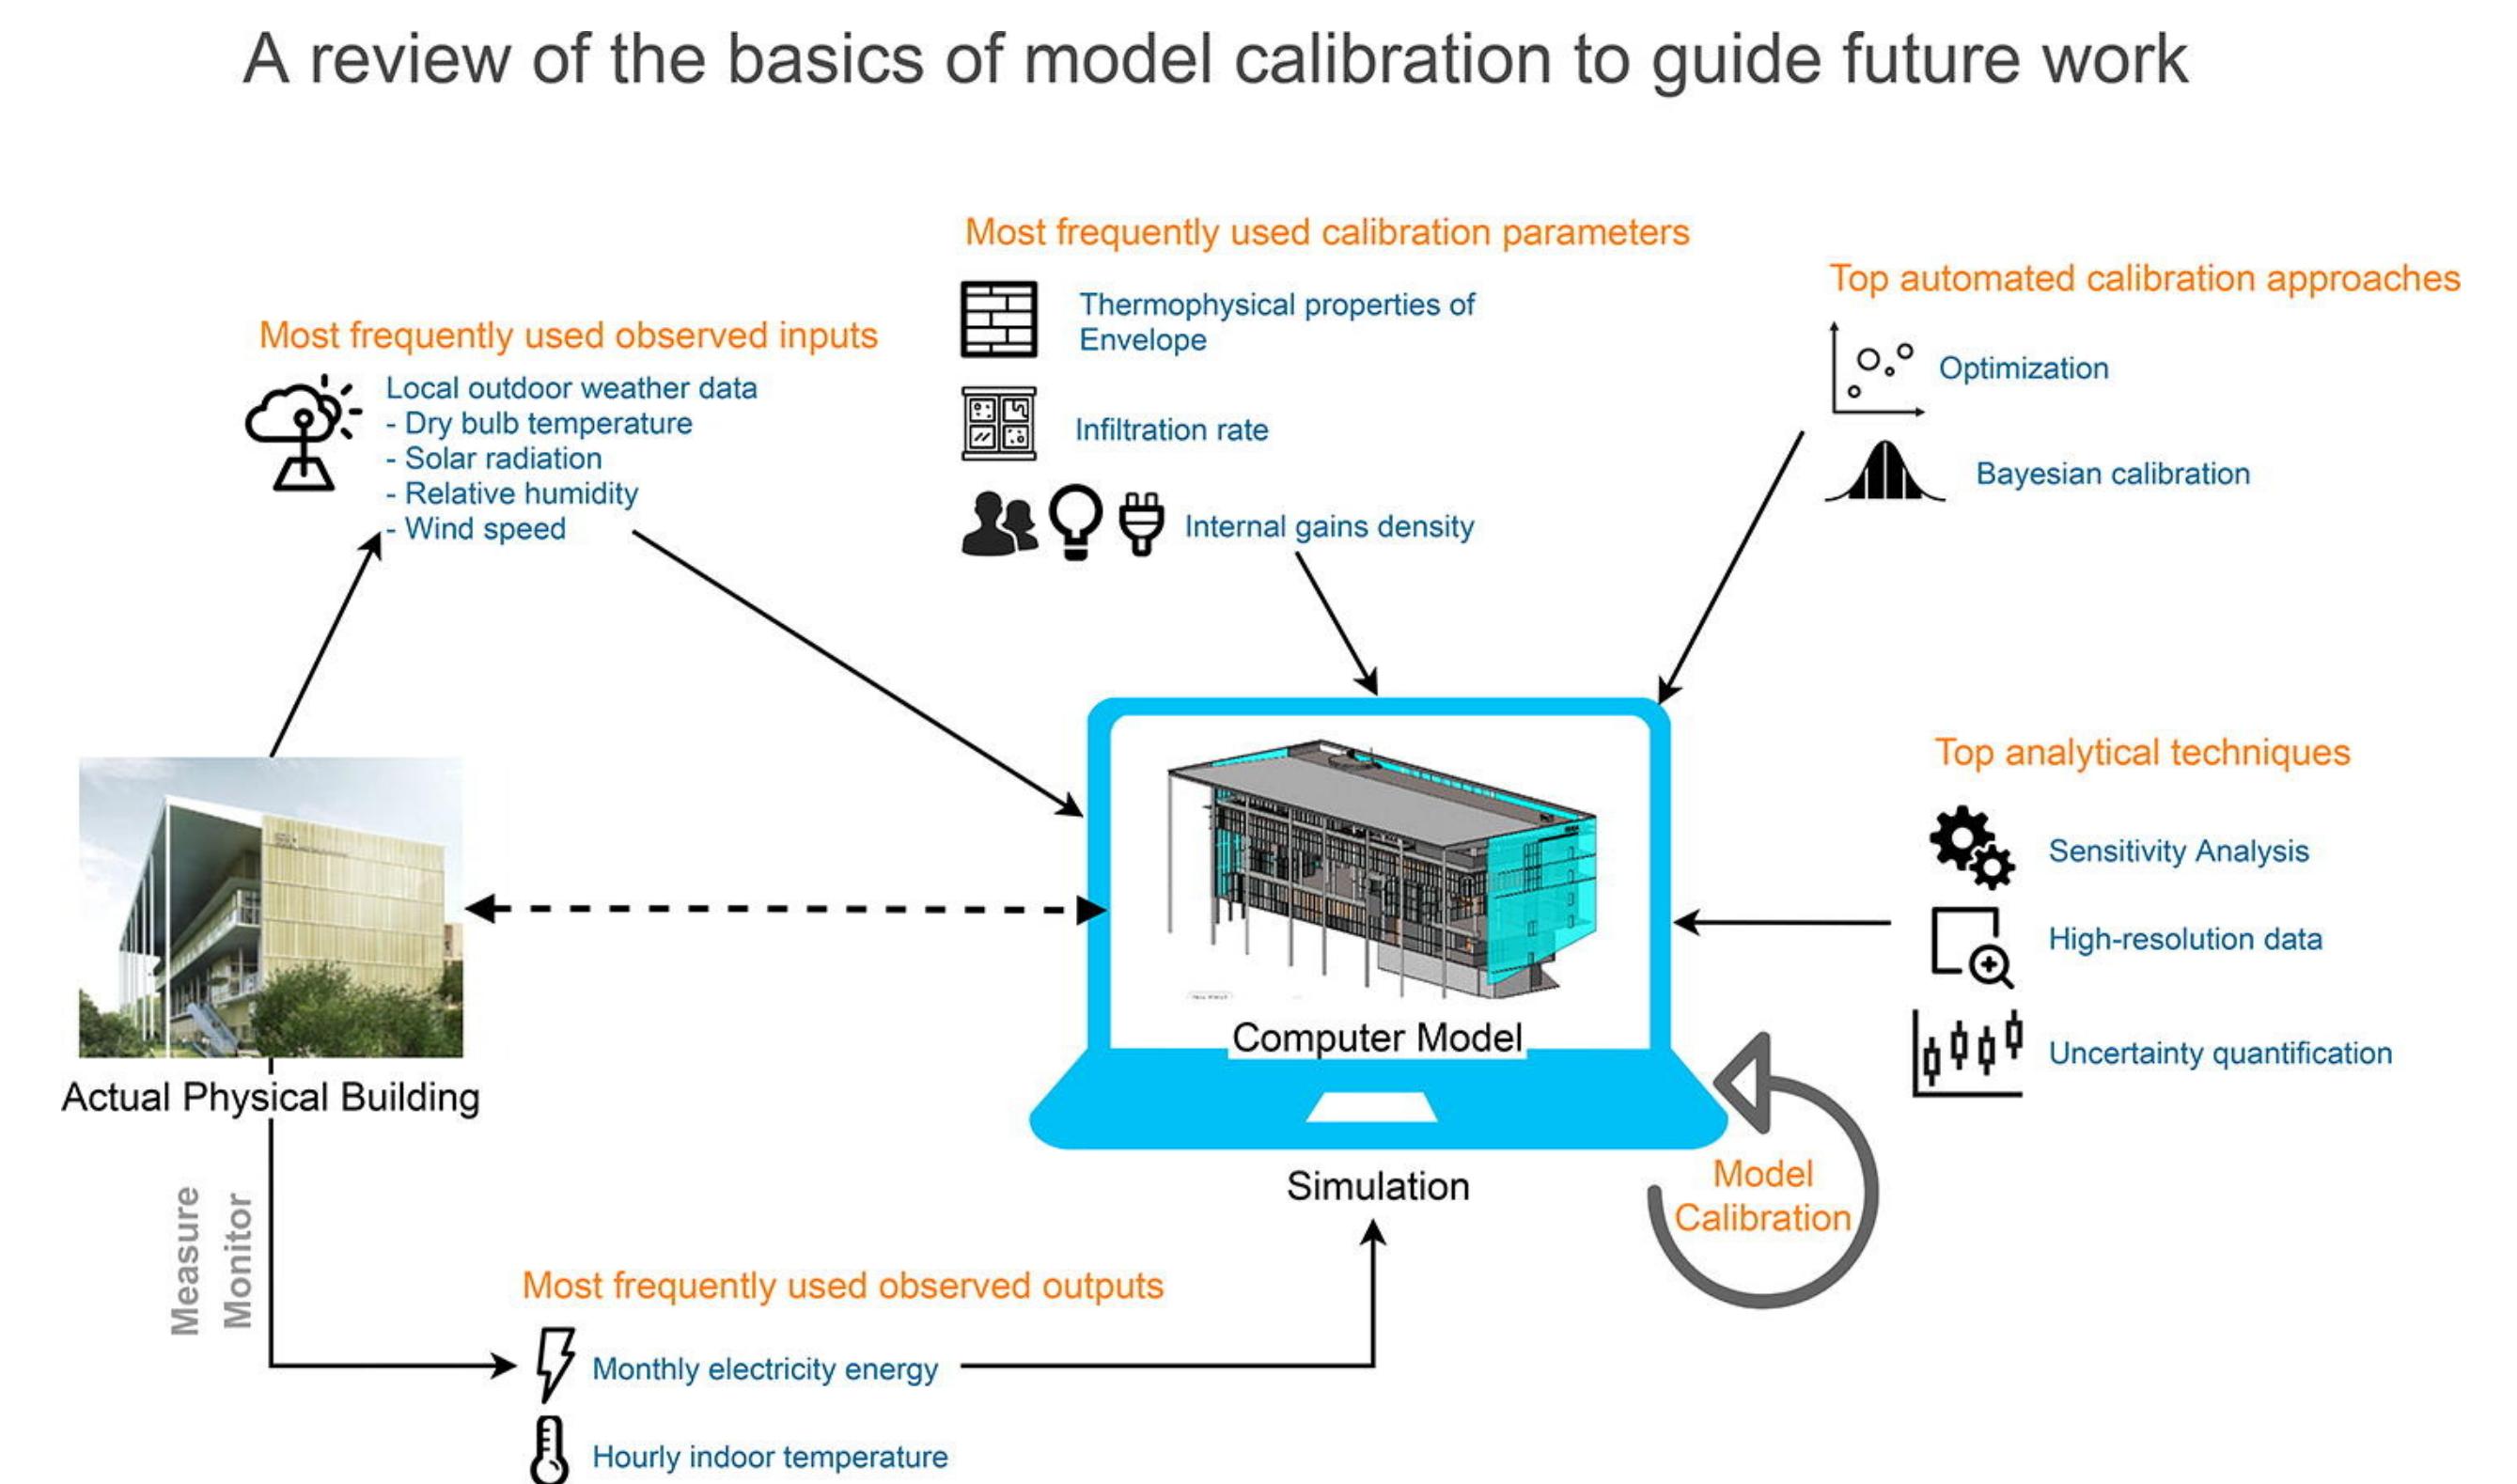

A review of the basics of model calibration to guide future work

Why Calibration ?

Making scientific pronouncements
about phenomena that **cannot**
currently be studied experimentally.

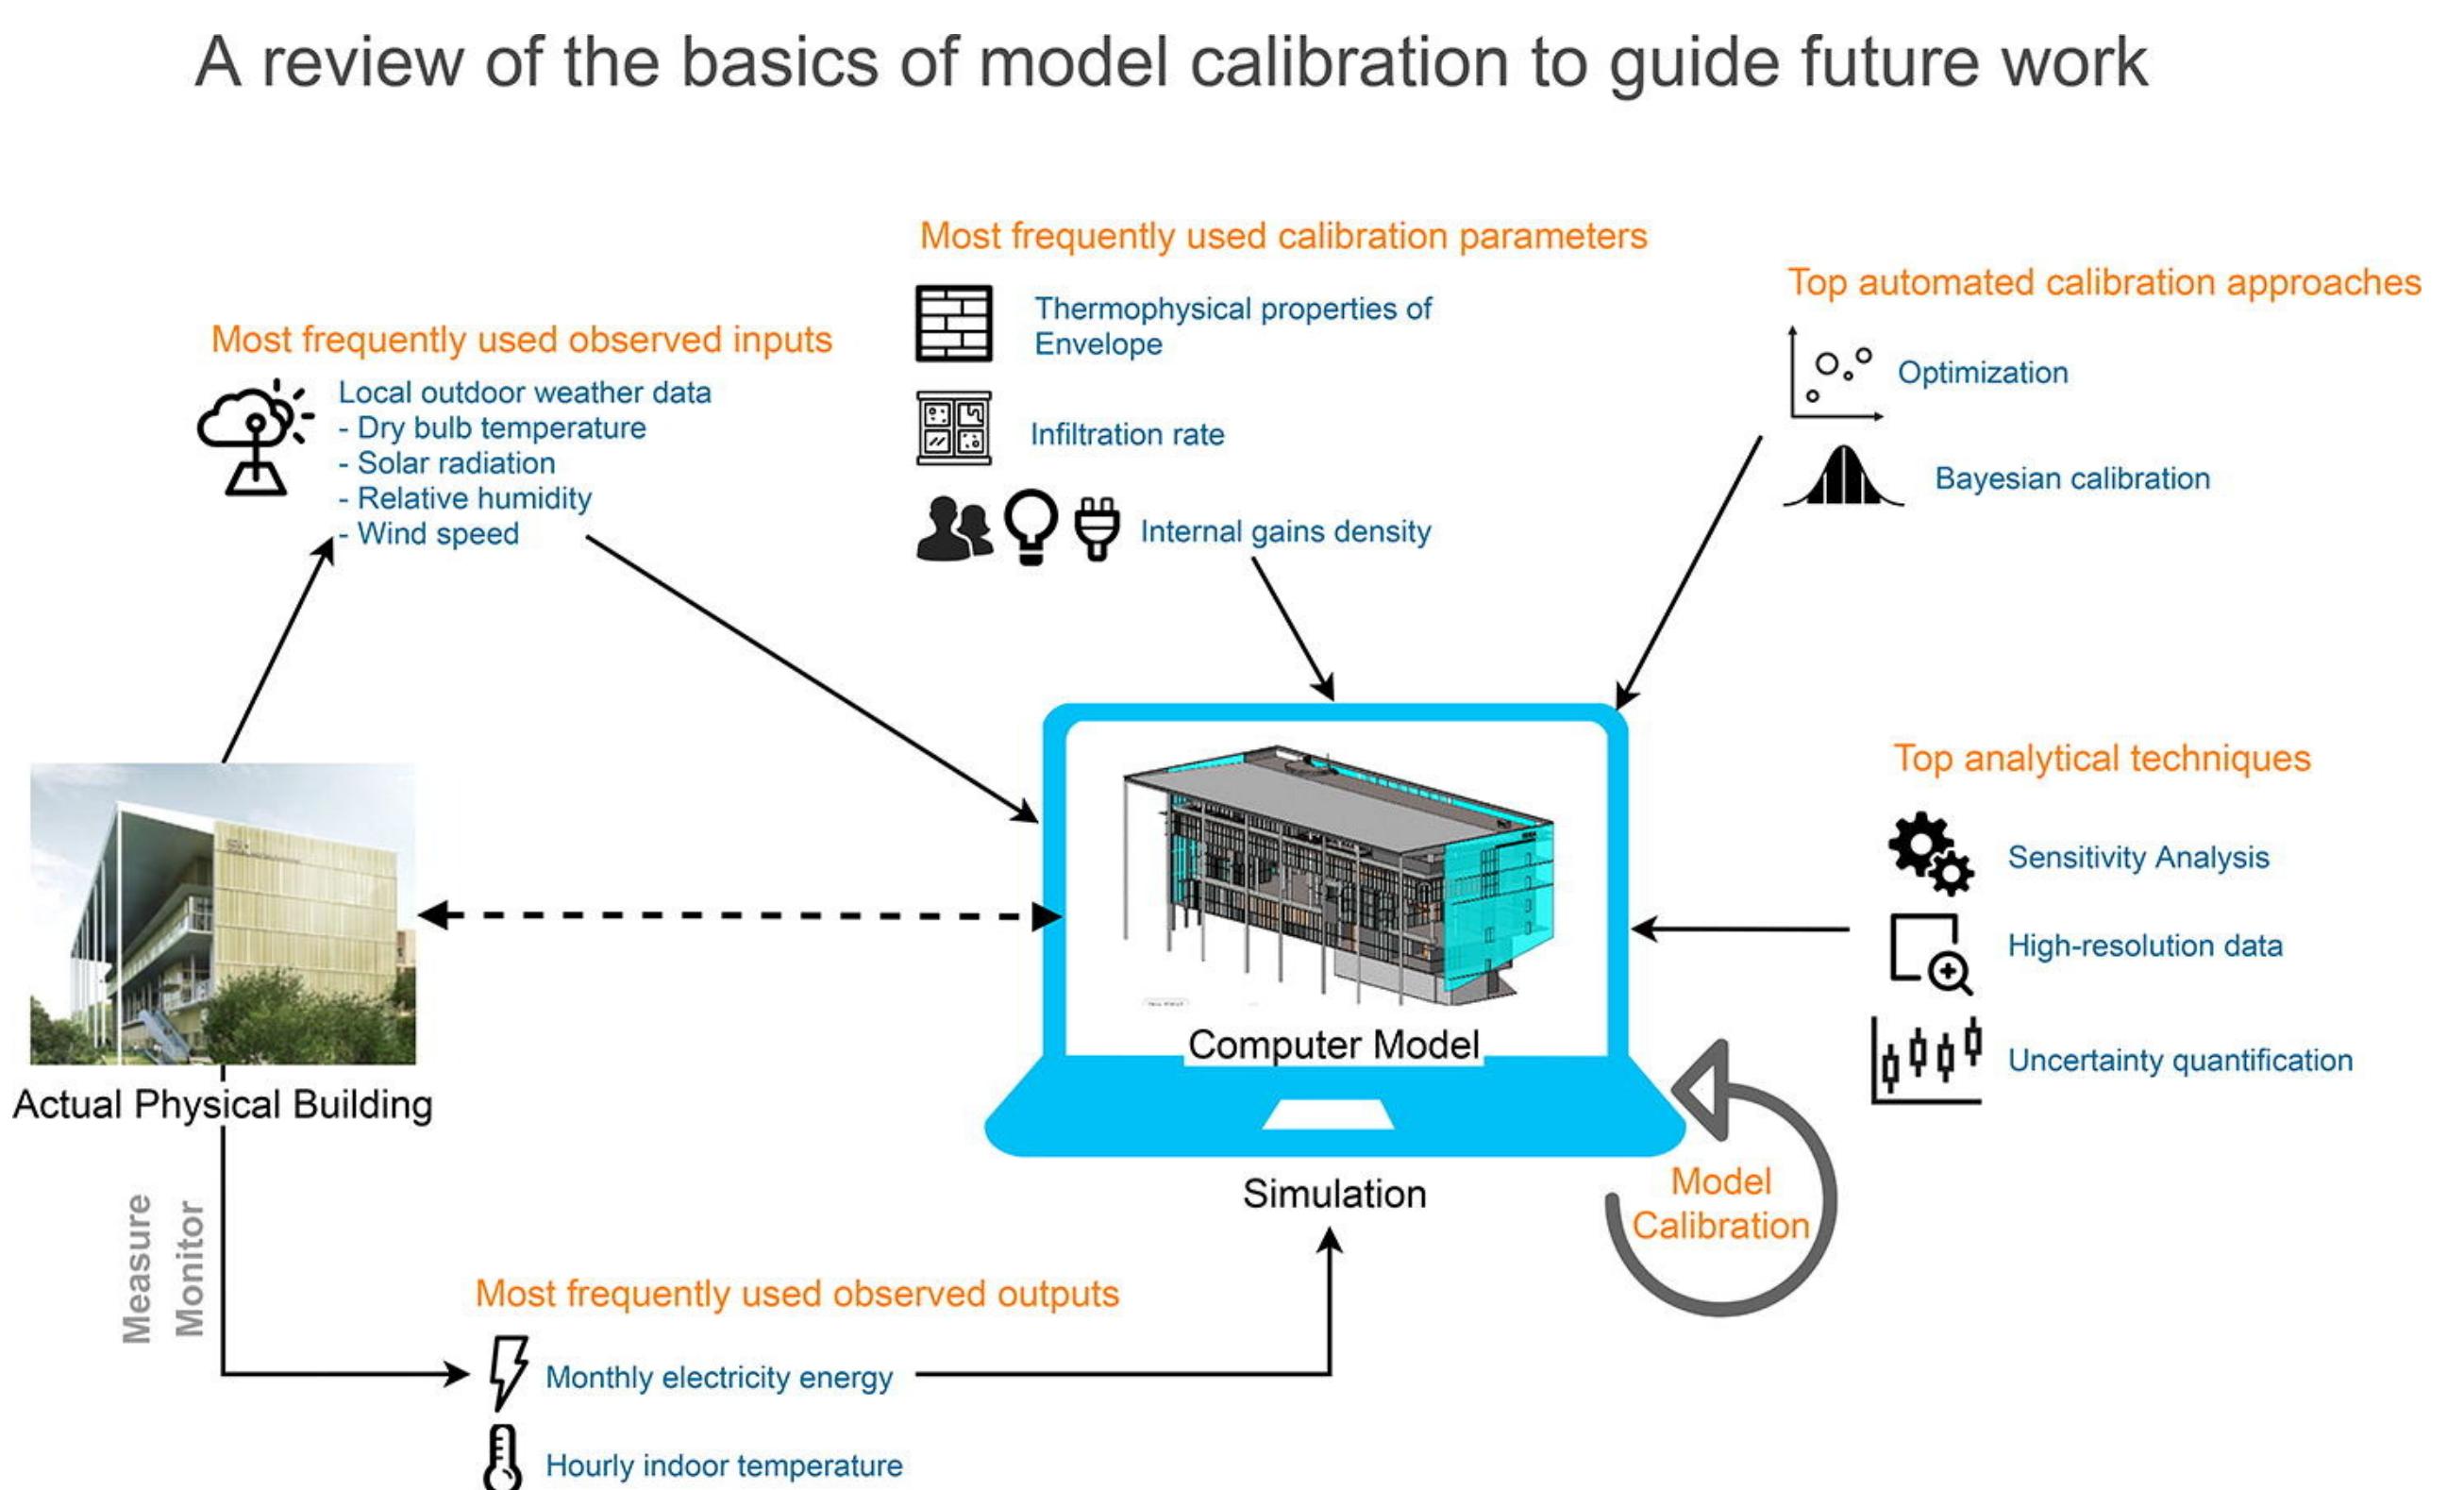

e.g., Observing changes in building
energy performance considering
different climate change scenarios or a
scenario where occupancy and
building usage can become sporadic in
the event of a pandemic.

Why Calibration ?

Using computation to extrapolate existing understanding into experimentally unexplored regimes.

e.g., using BES to create a baseline for quantifying energy savings for buildings with multiple interactive ECMS.

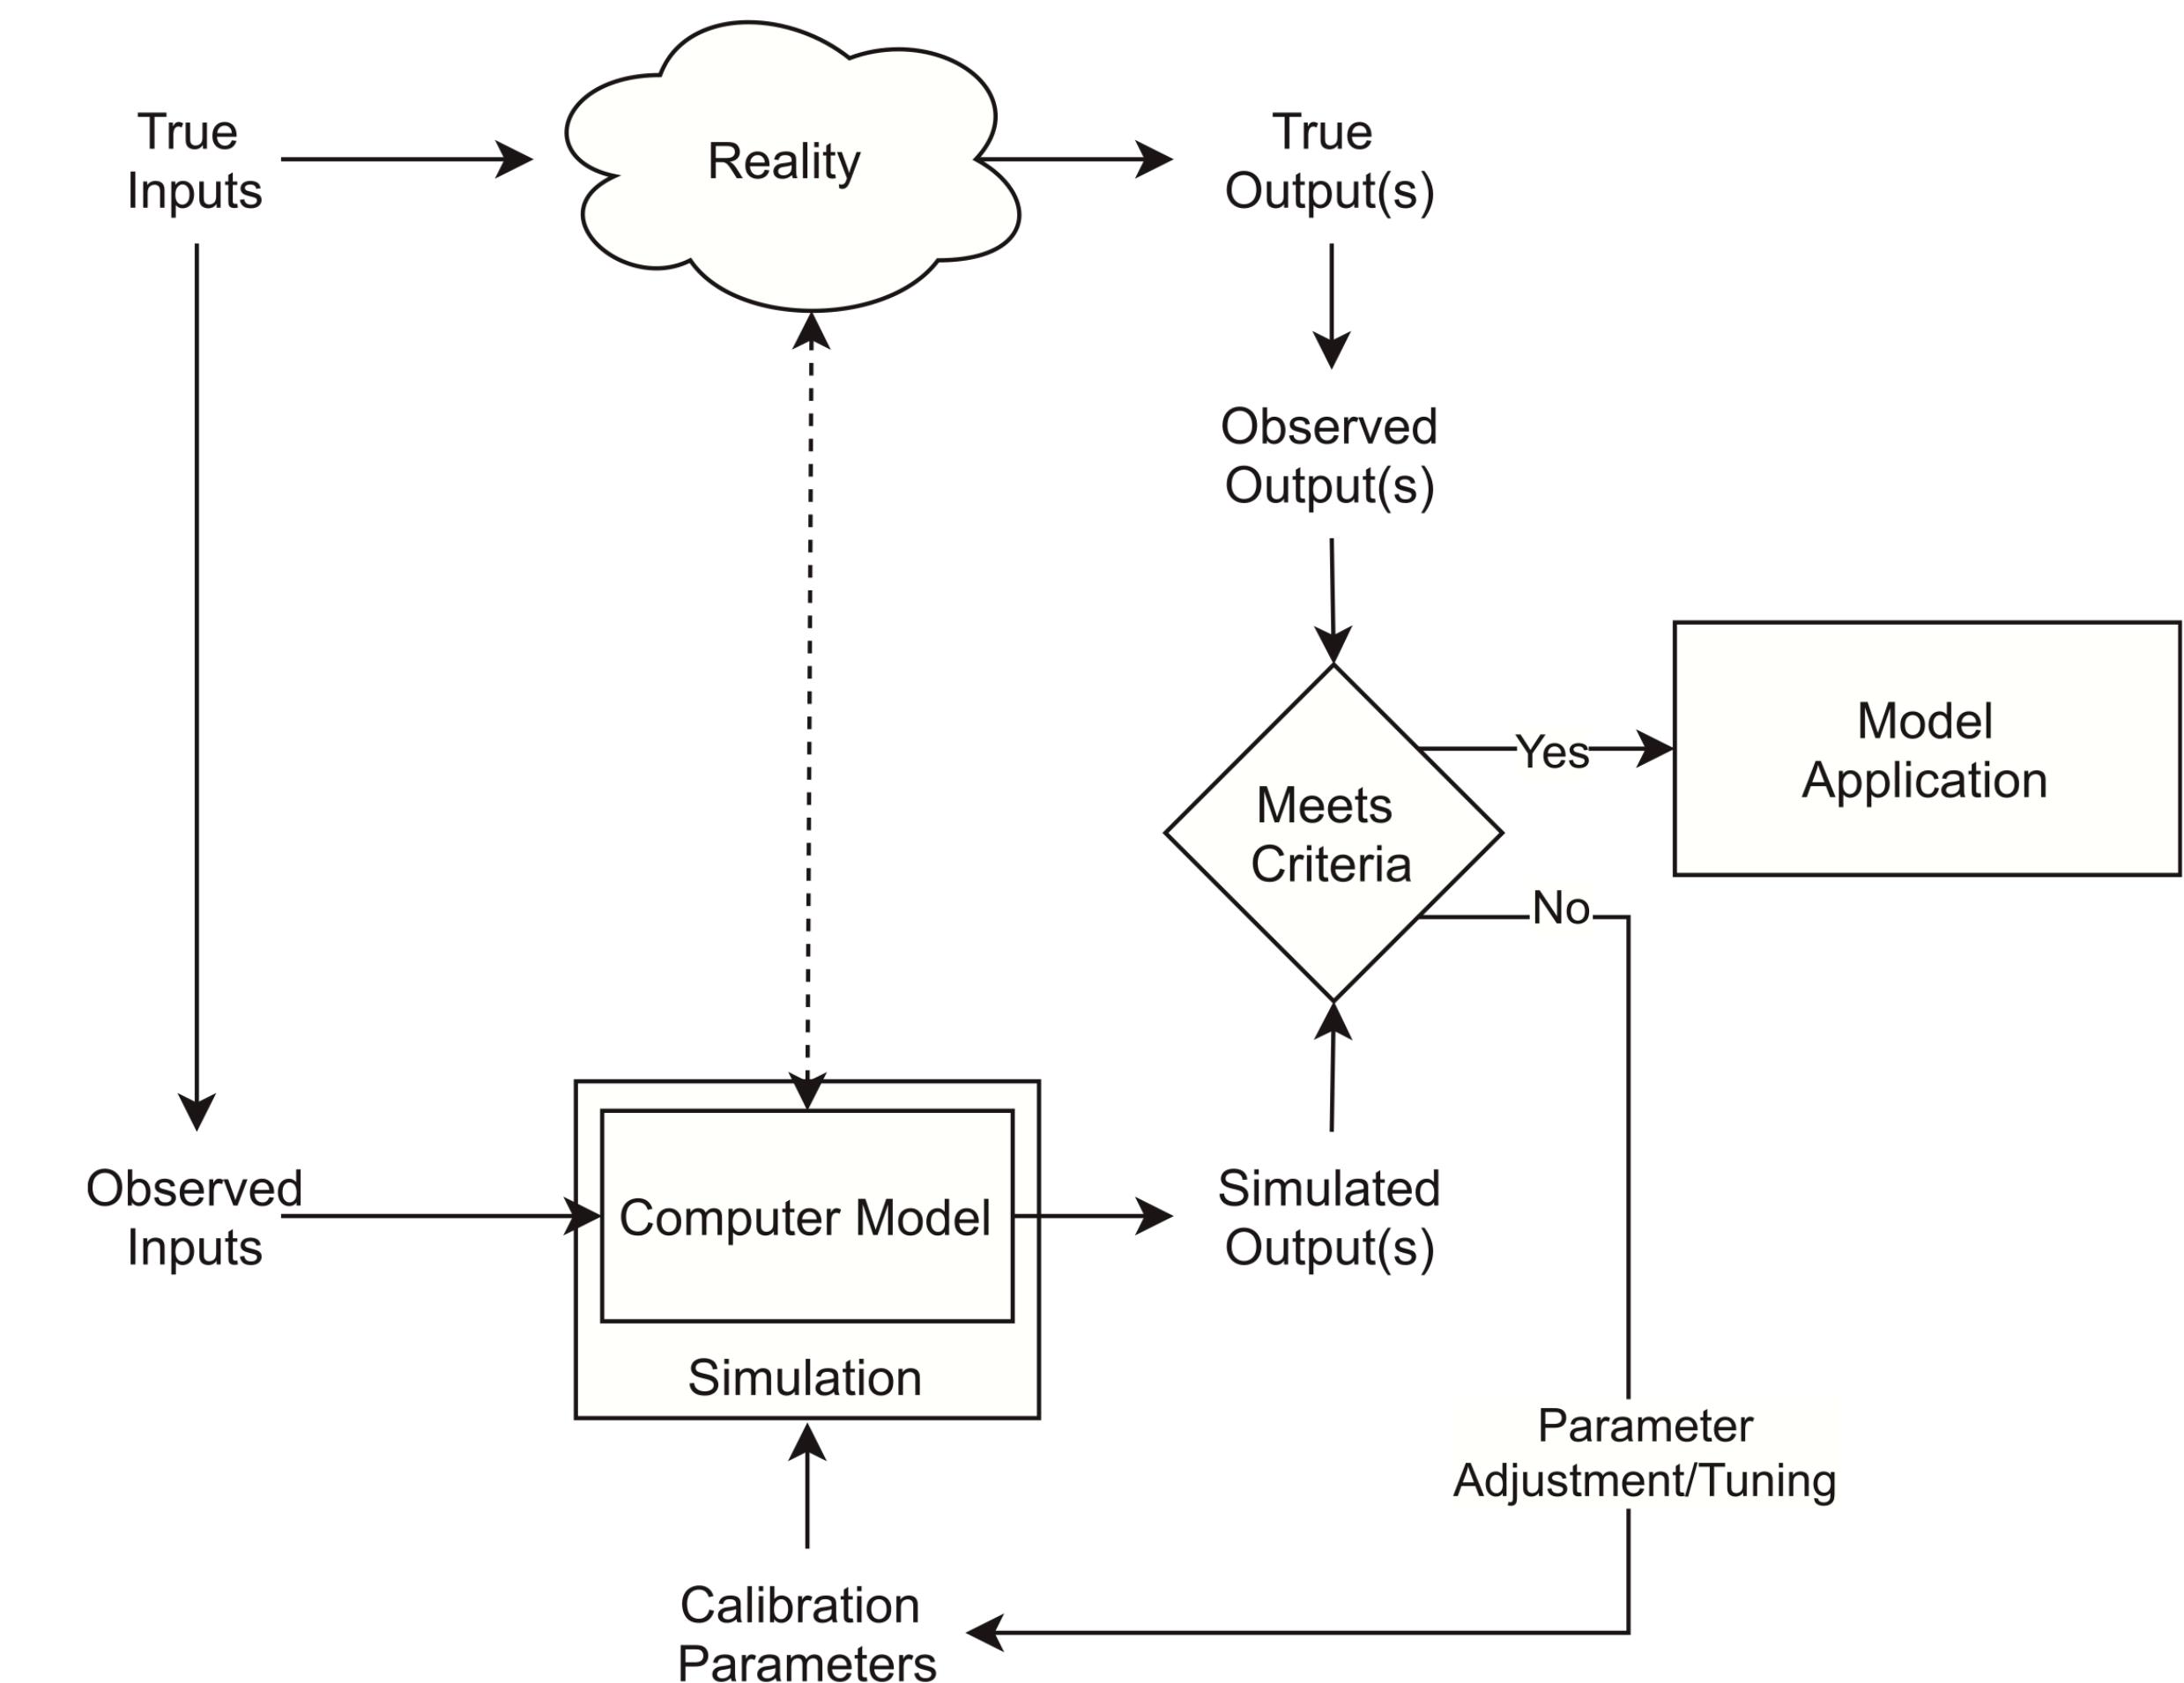

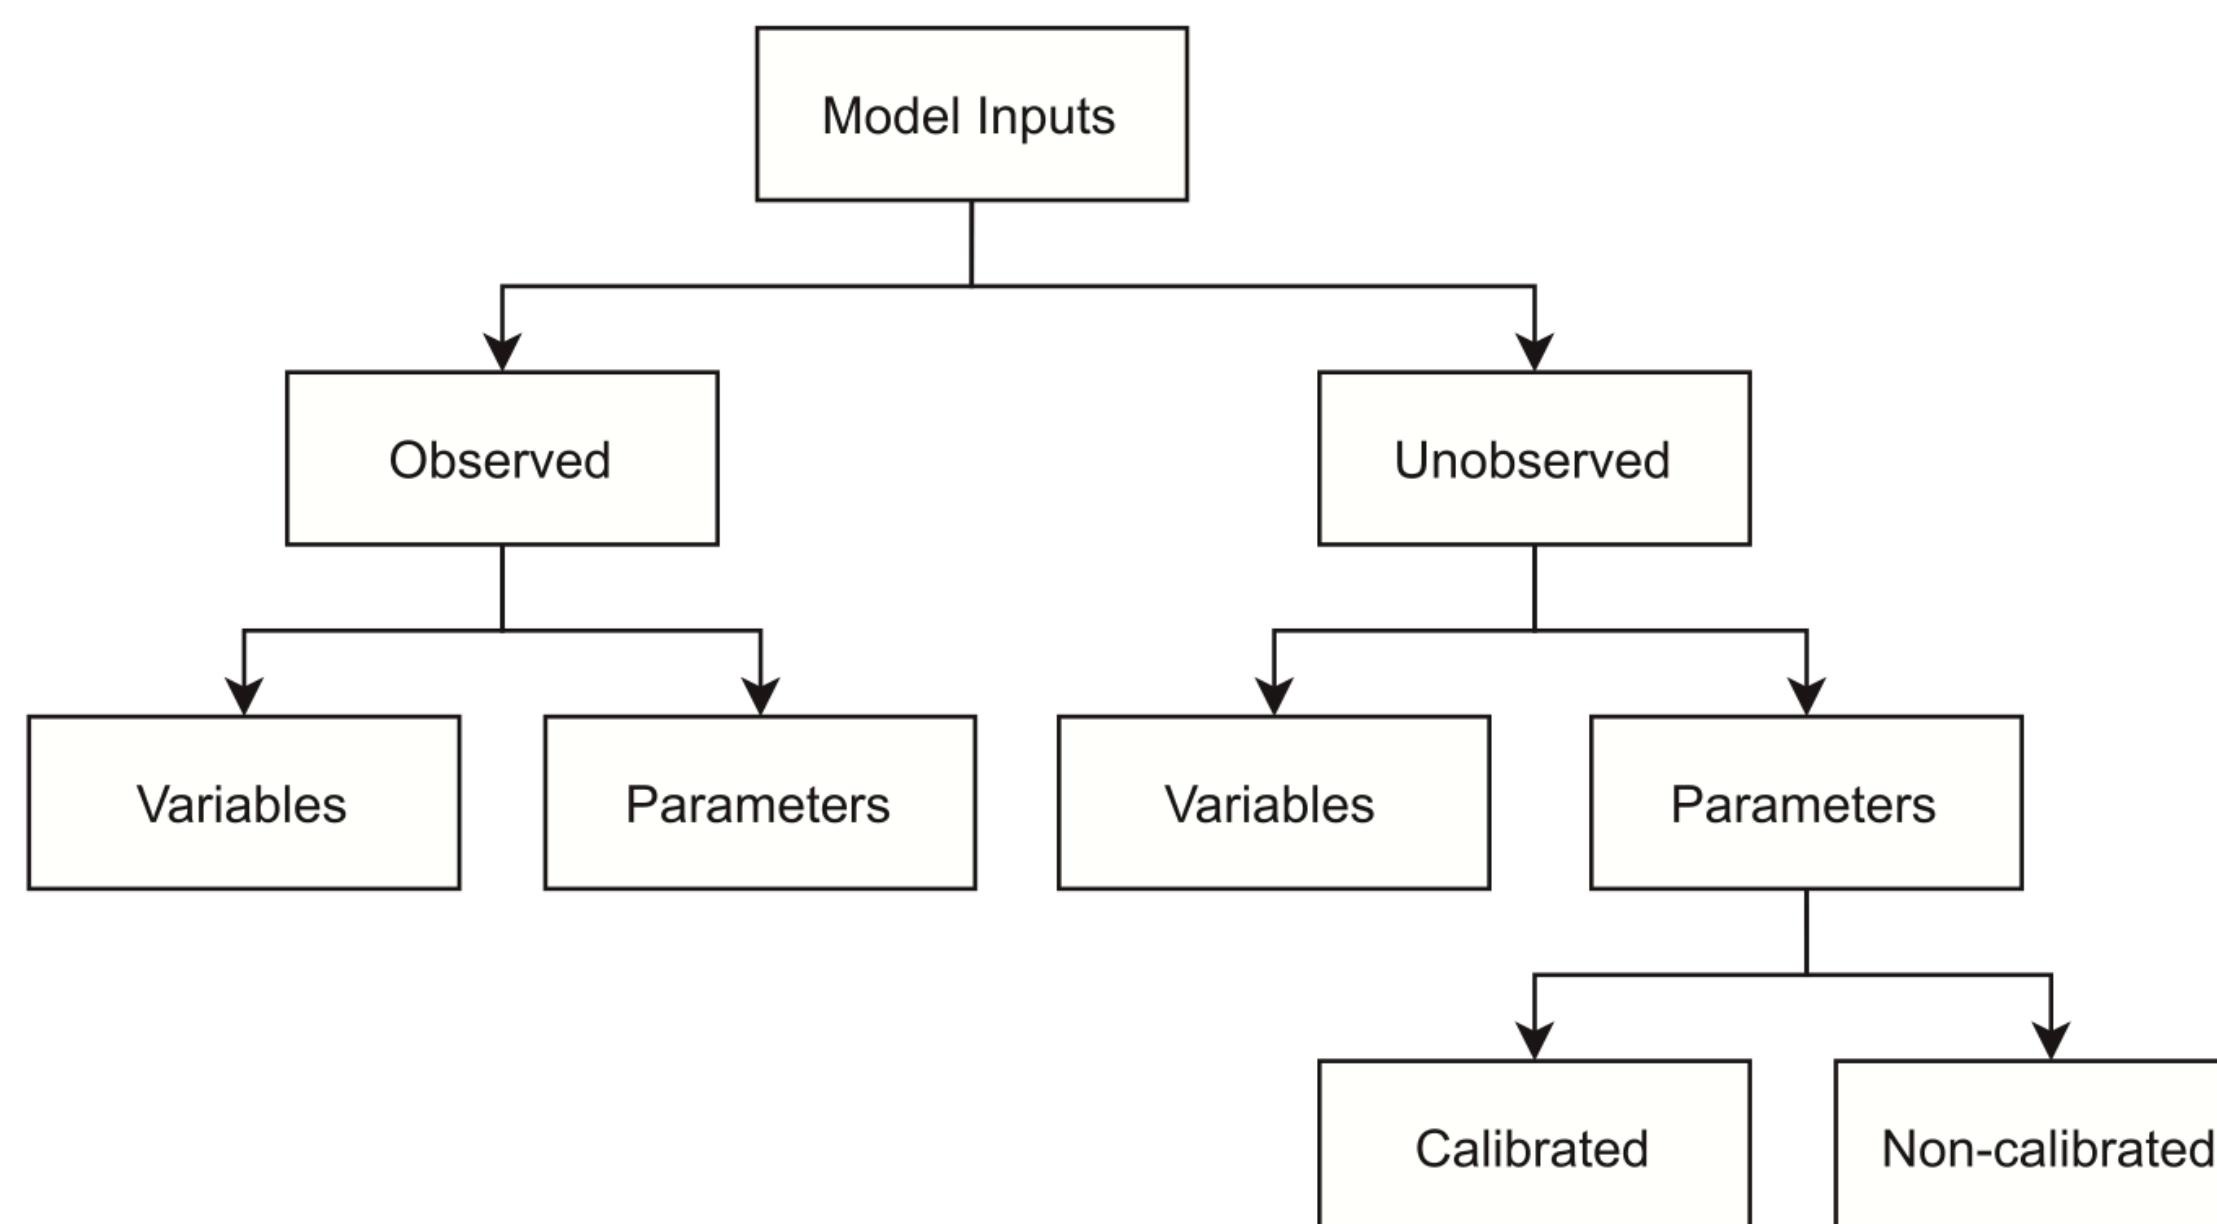

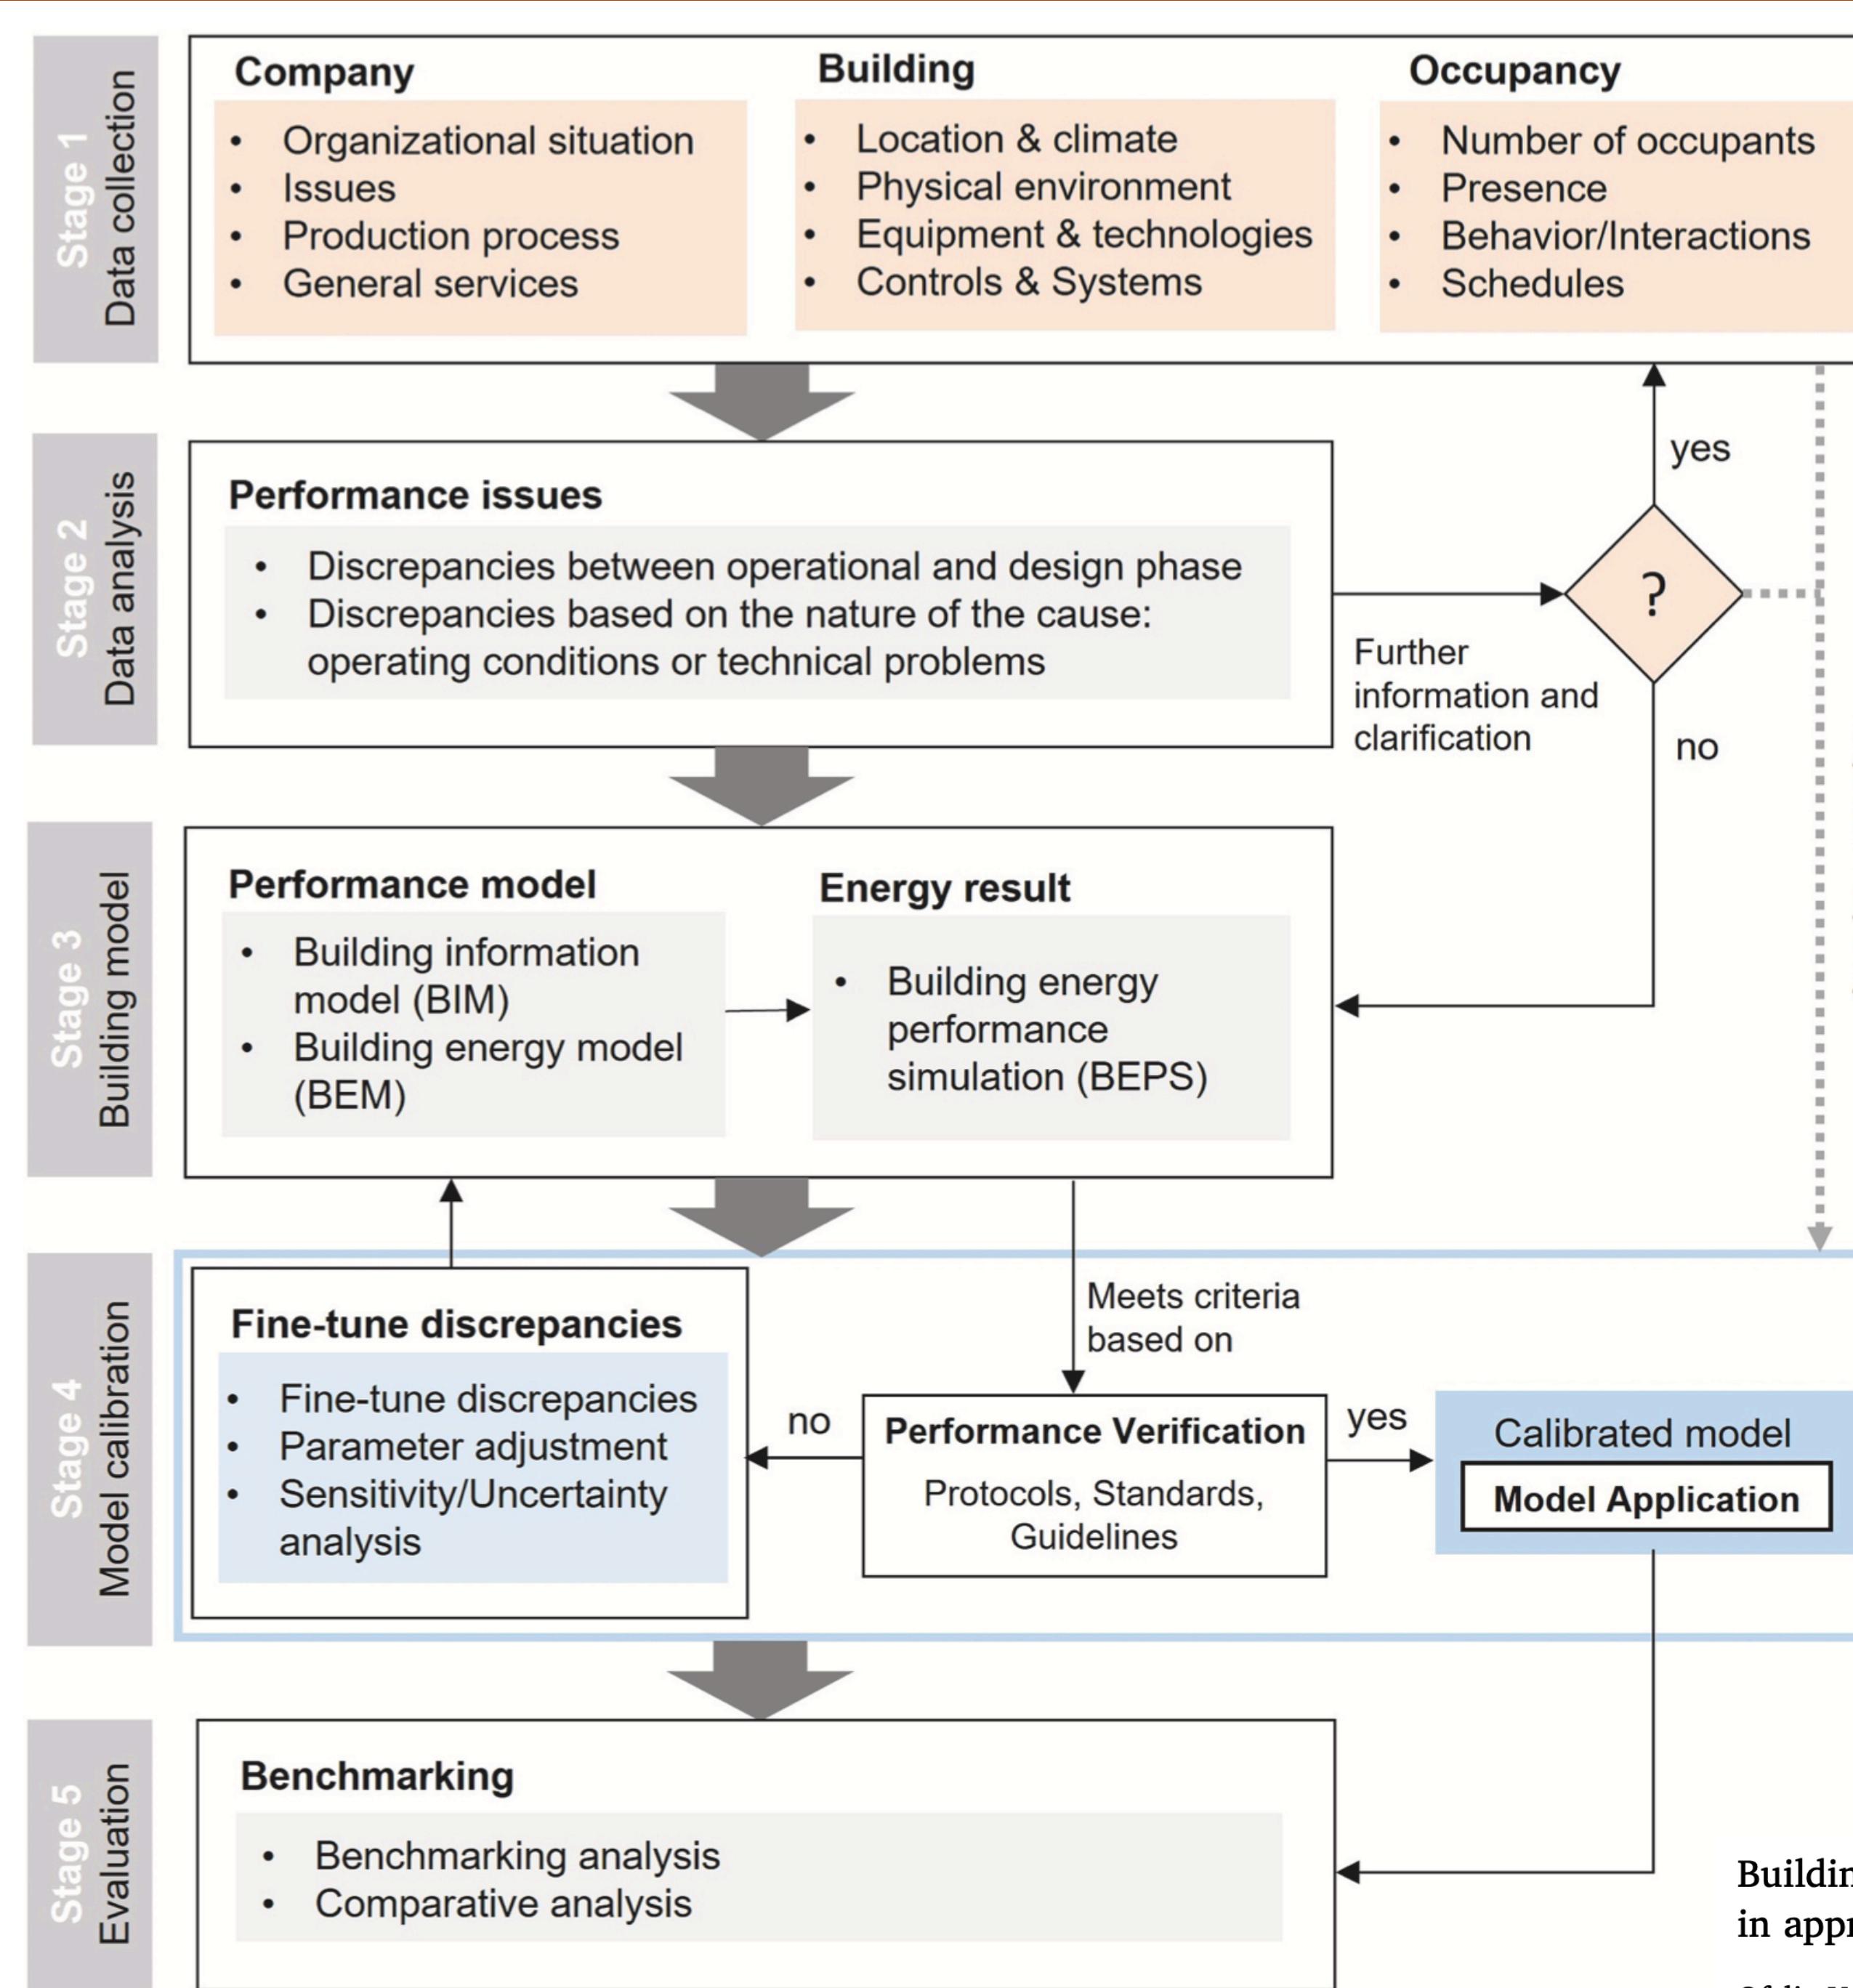

Key Calibration Approaches

- Manual vs Automated
- Automated calibration
 - mathematical optimization
 - genetic algorithms, particle swarm optimization
 - bayesian calibration
 - ability to naturally incorporate uncertainty and combine prior information with measured data to derive posterior estimates of the model parameters

Calibration: The process of adjusting numerical or physical modeling parameters in the computational model for the purpose of improving agreement with experimental data.

Calibration Schematic

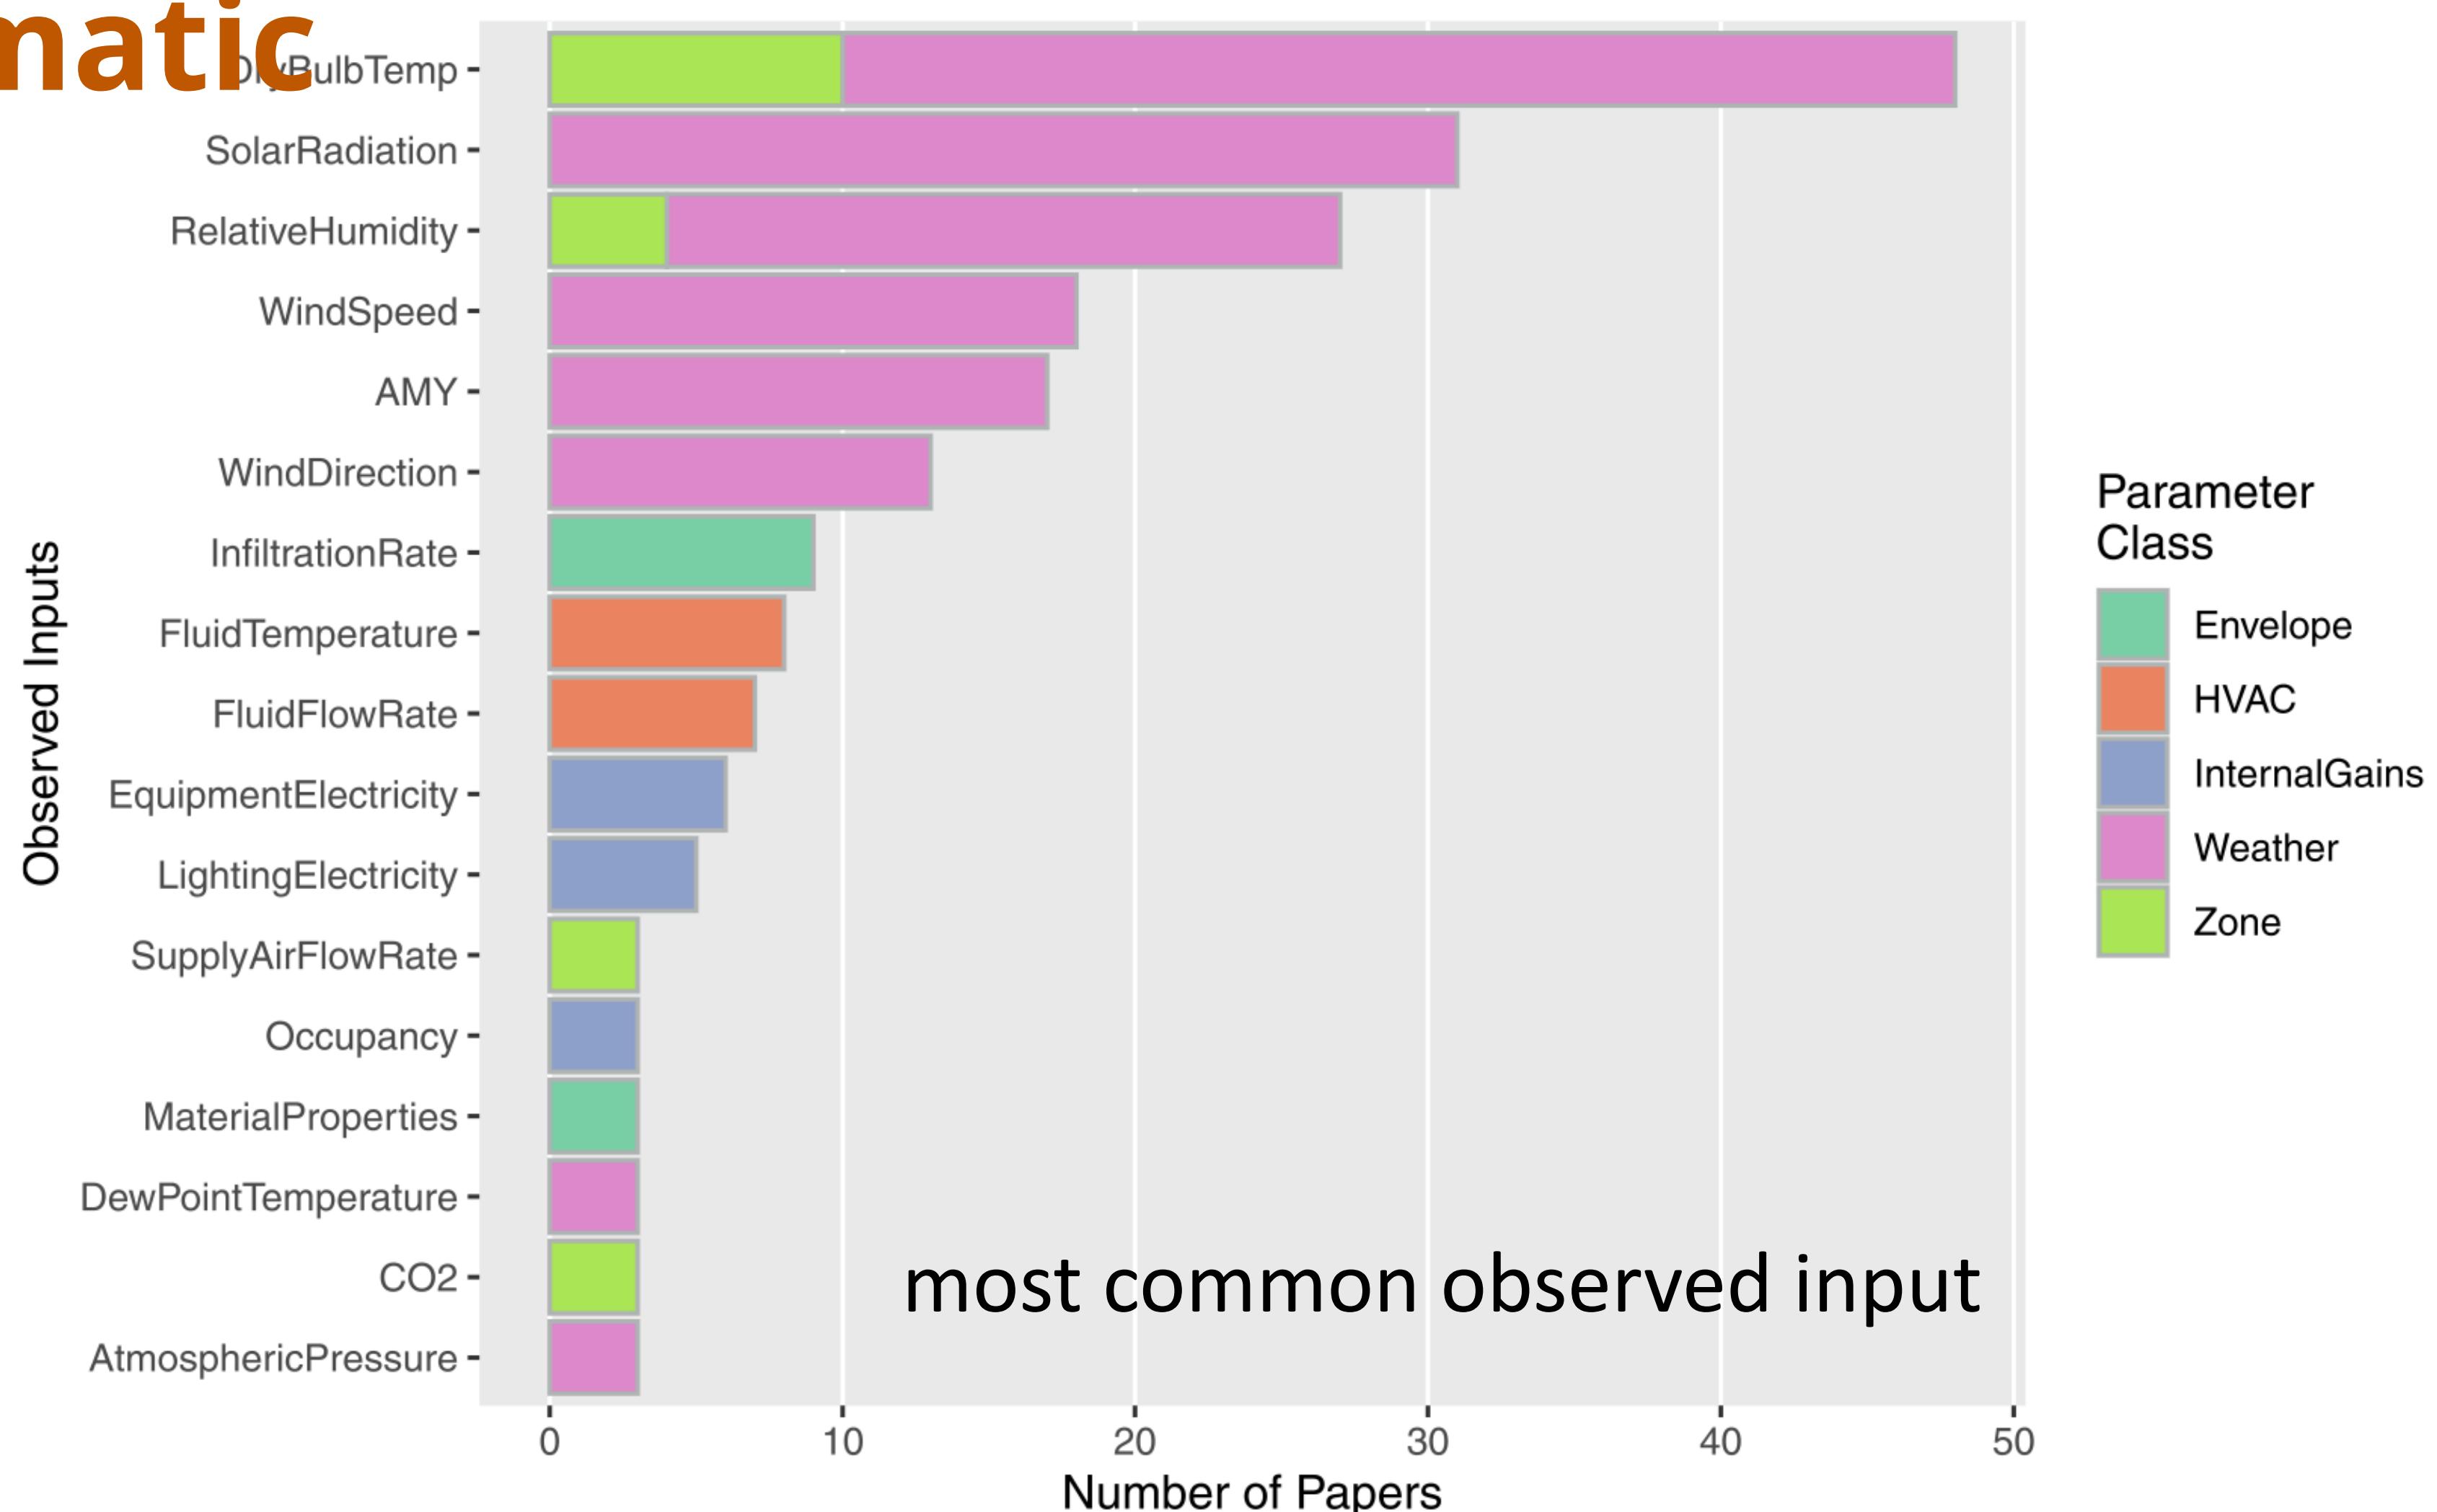

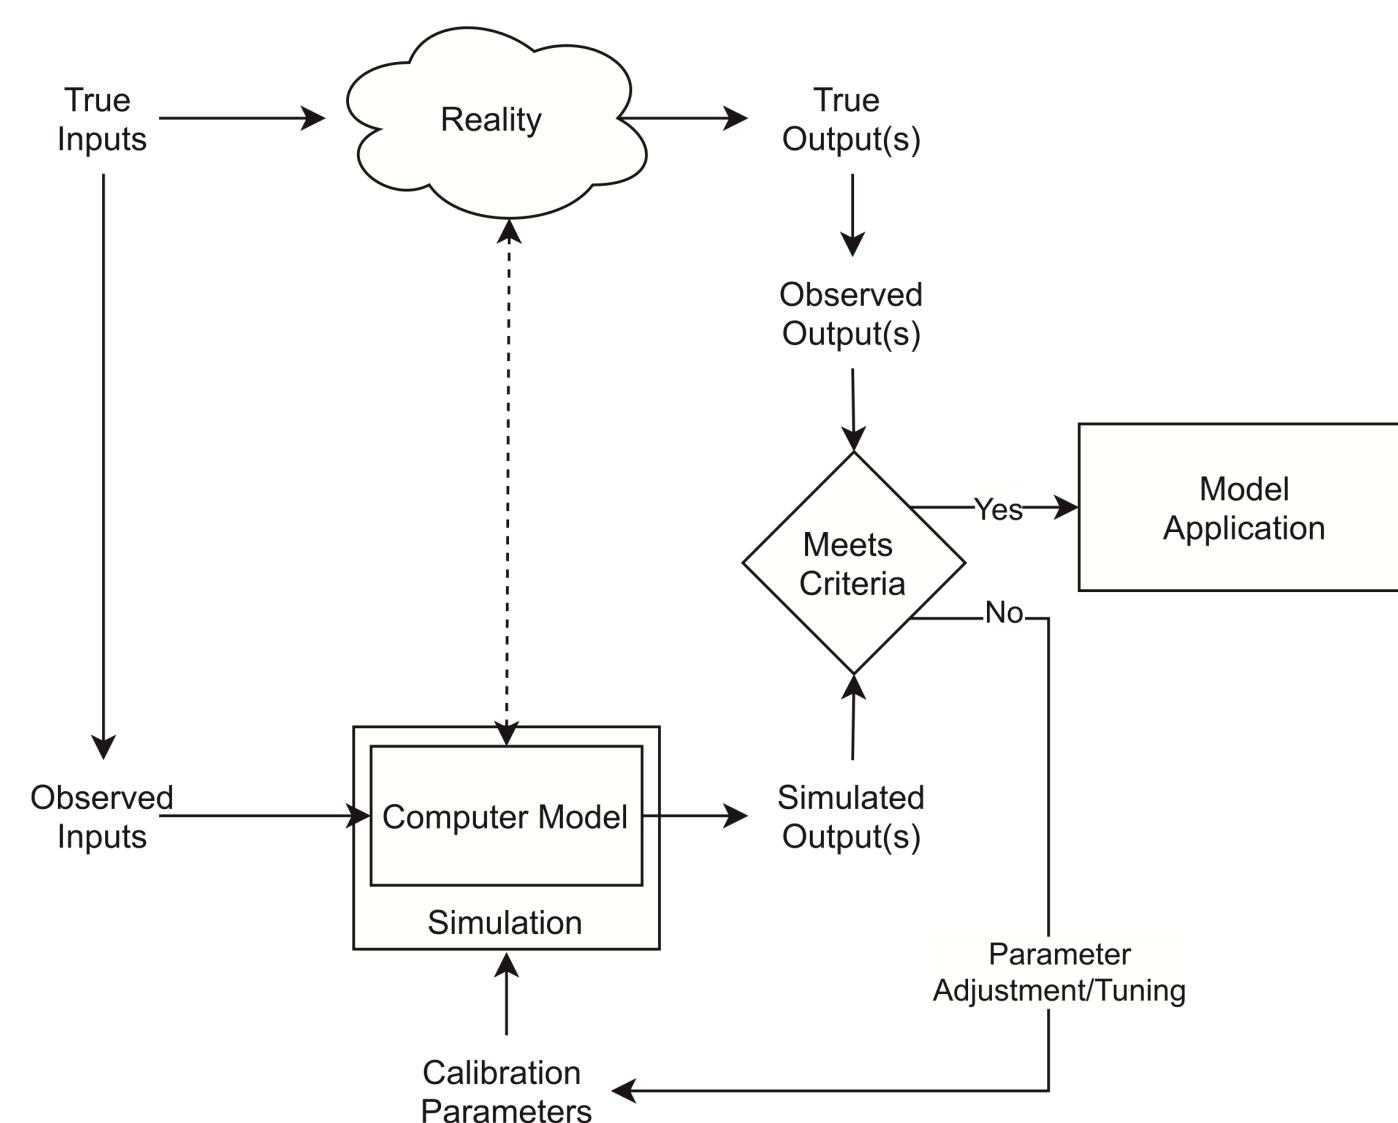

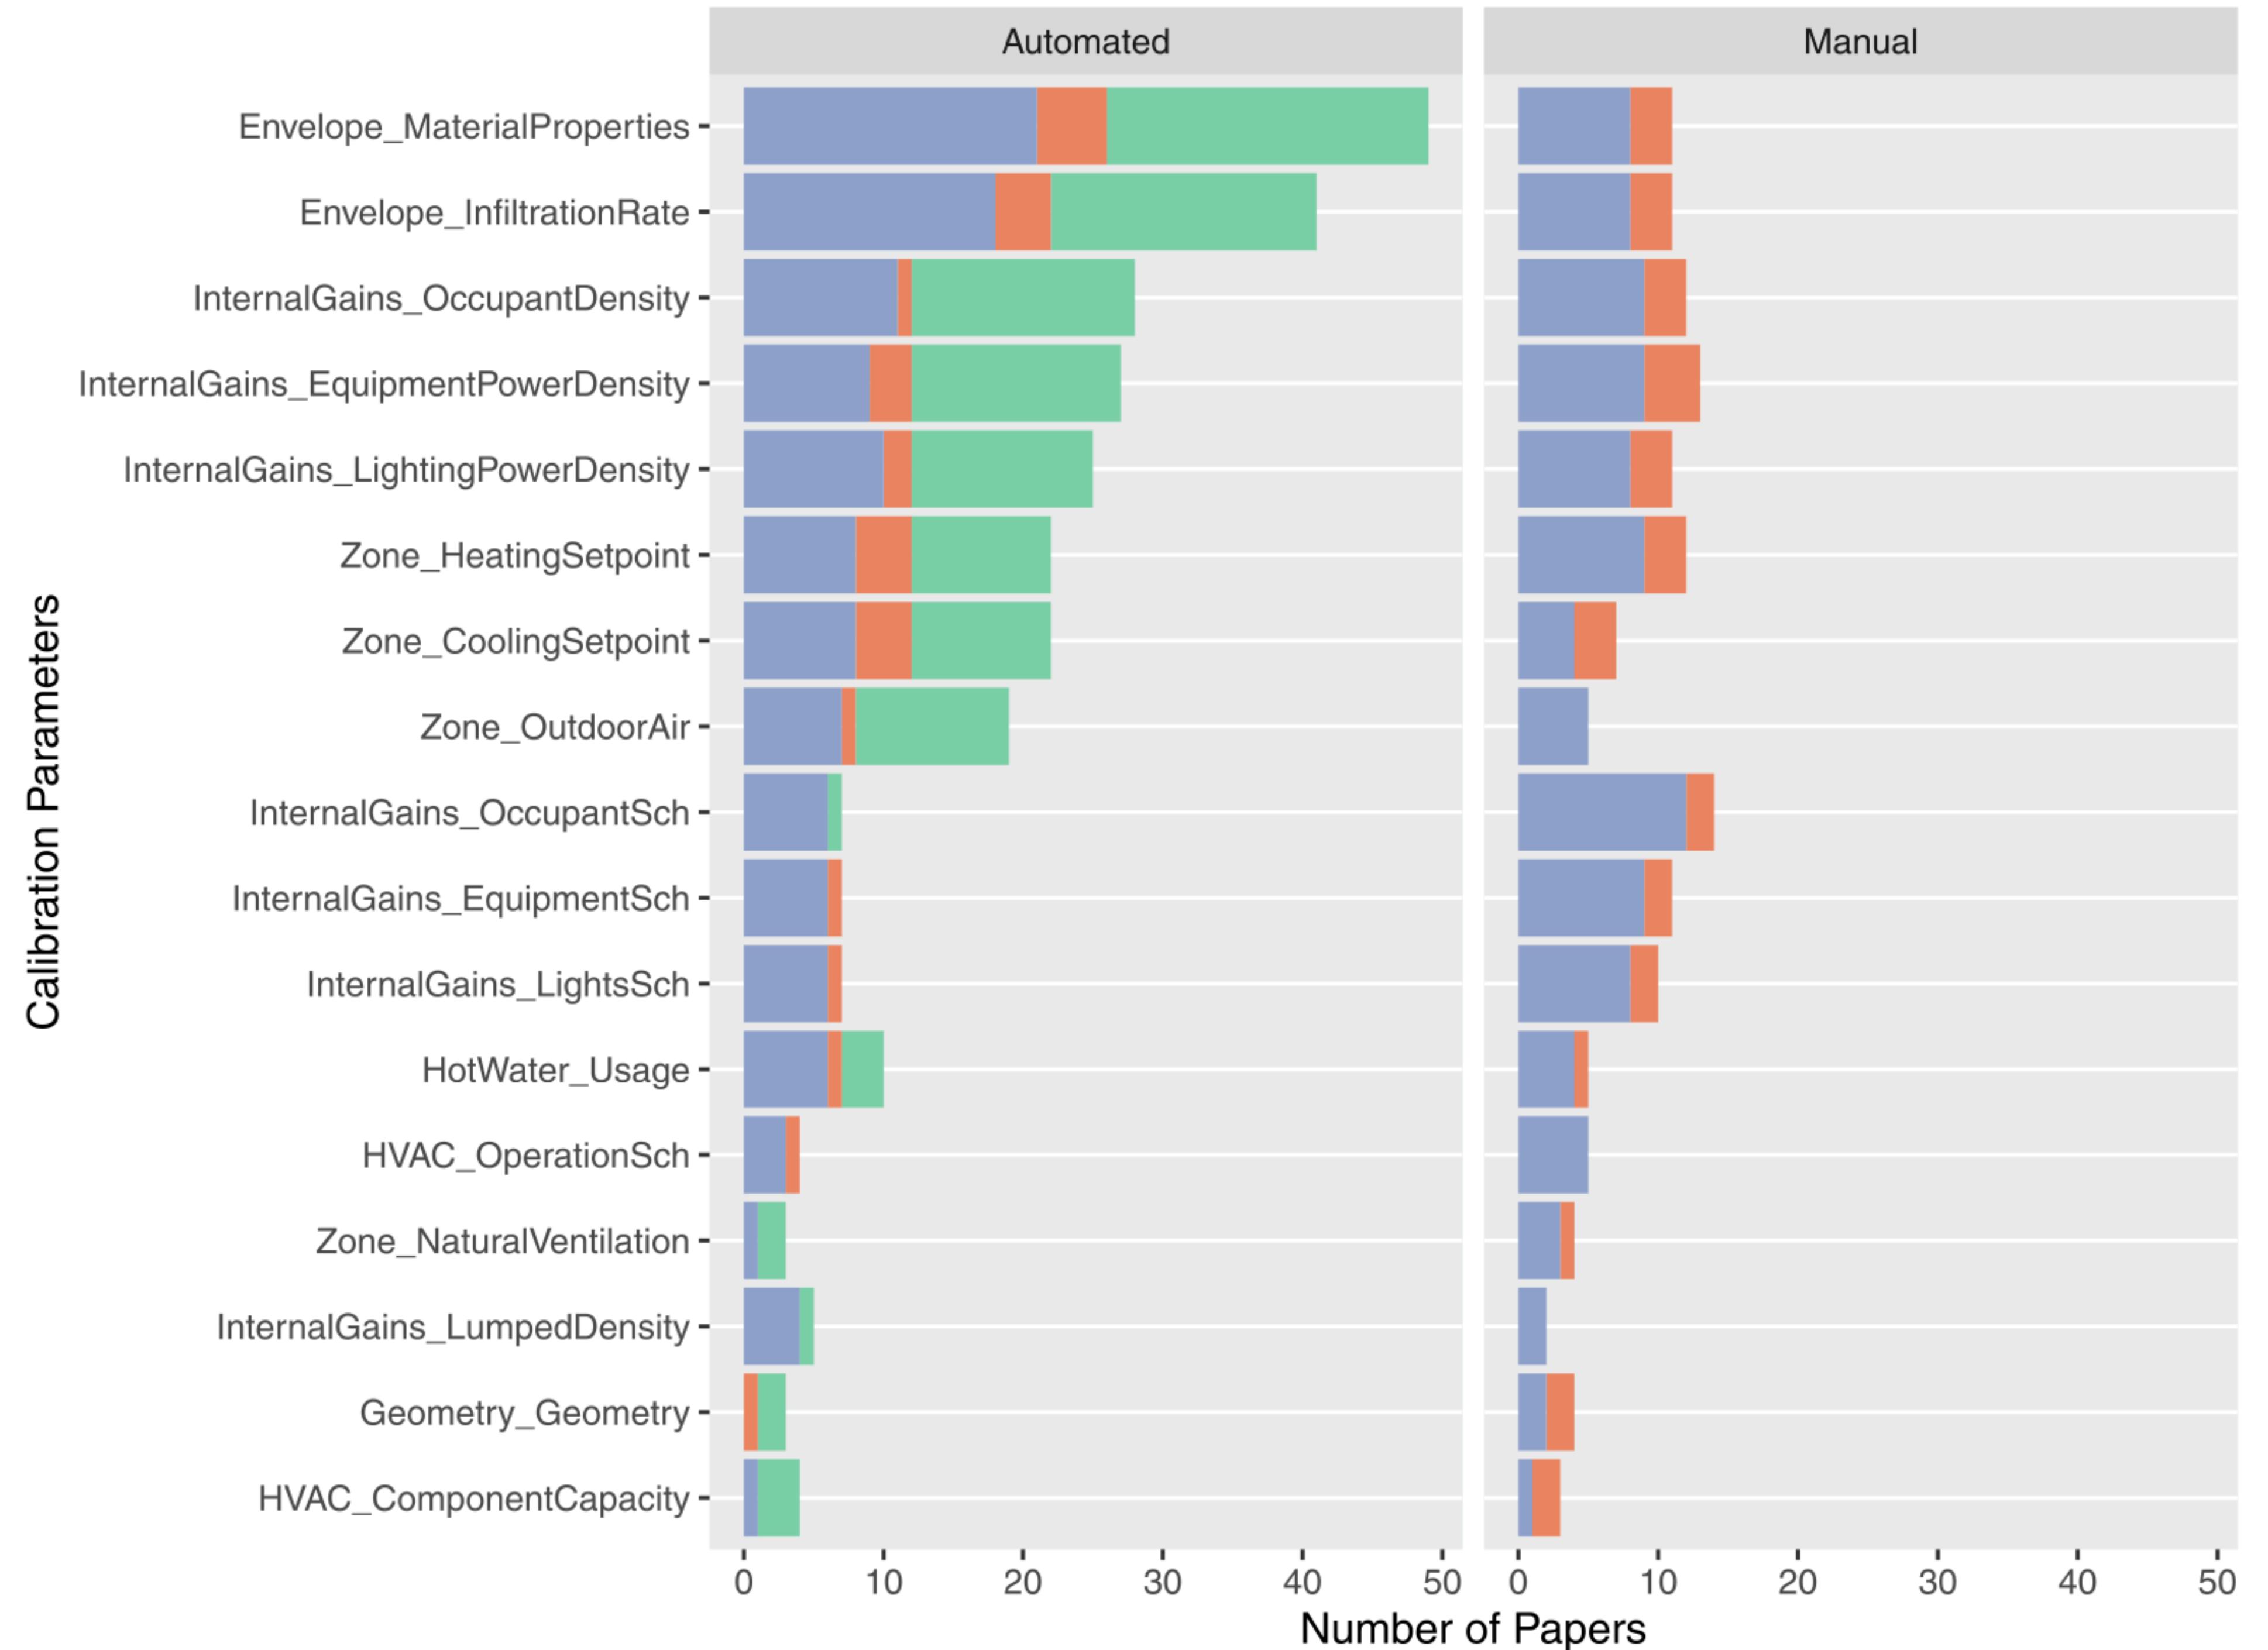

Building energy model calibration: A review of the state of the art in approaches, methods, and tools

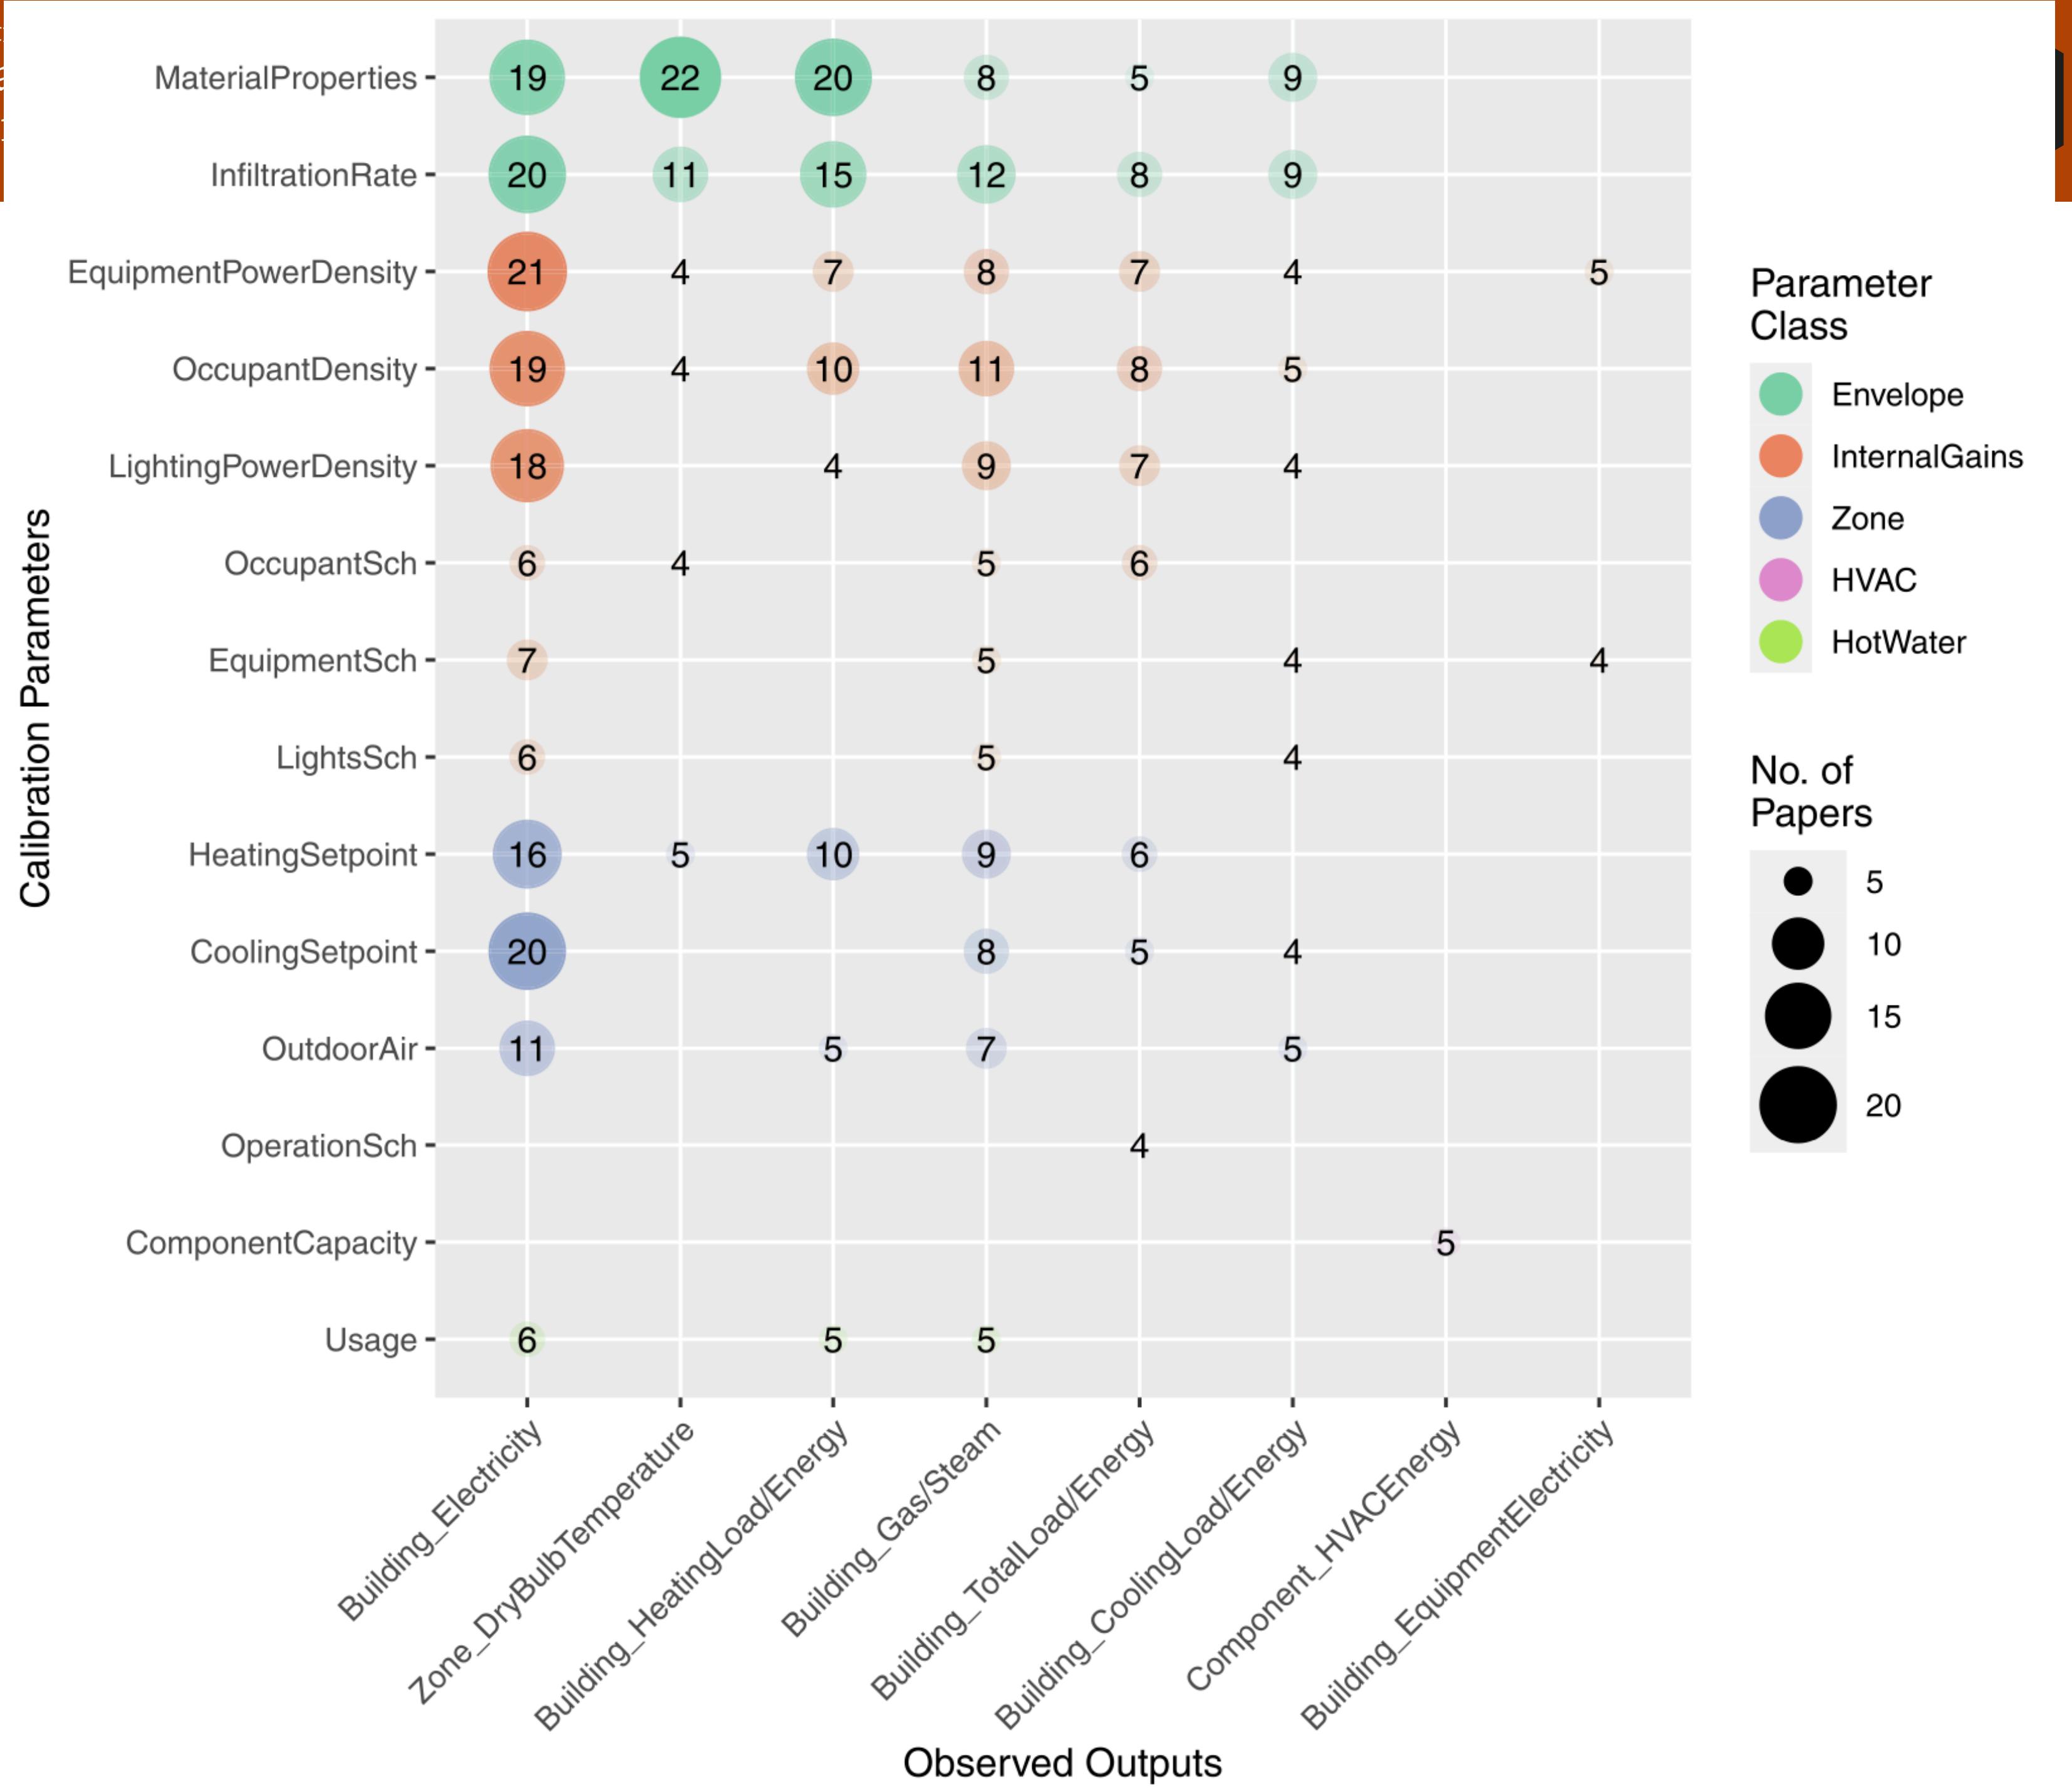

Ofelia Vera-Piazzini ^{a,*}, Massimiliano Scarpa ^b

Fig. 12. Generalized model calibration process based on the reviewed literature.

Calibration Schematic

Calibration Evaluation

$$CV(RMSE) = \frac{1}{\bar{m}} \cdot \sqrt{\frac{\sum_{i=1}^n (m_i - s_i)^2}{n - p}} \times 100$$

$$NMBE(\%) = \frac{1}{\bar{m}} \cdot \frac{\sum_{i=1}^n (m_i - s_i)}{n - p} \times 100$$

Table 6

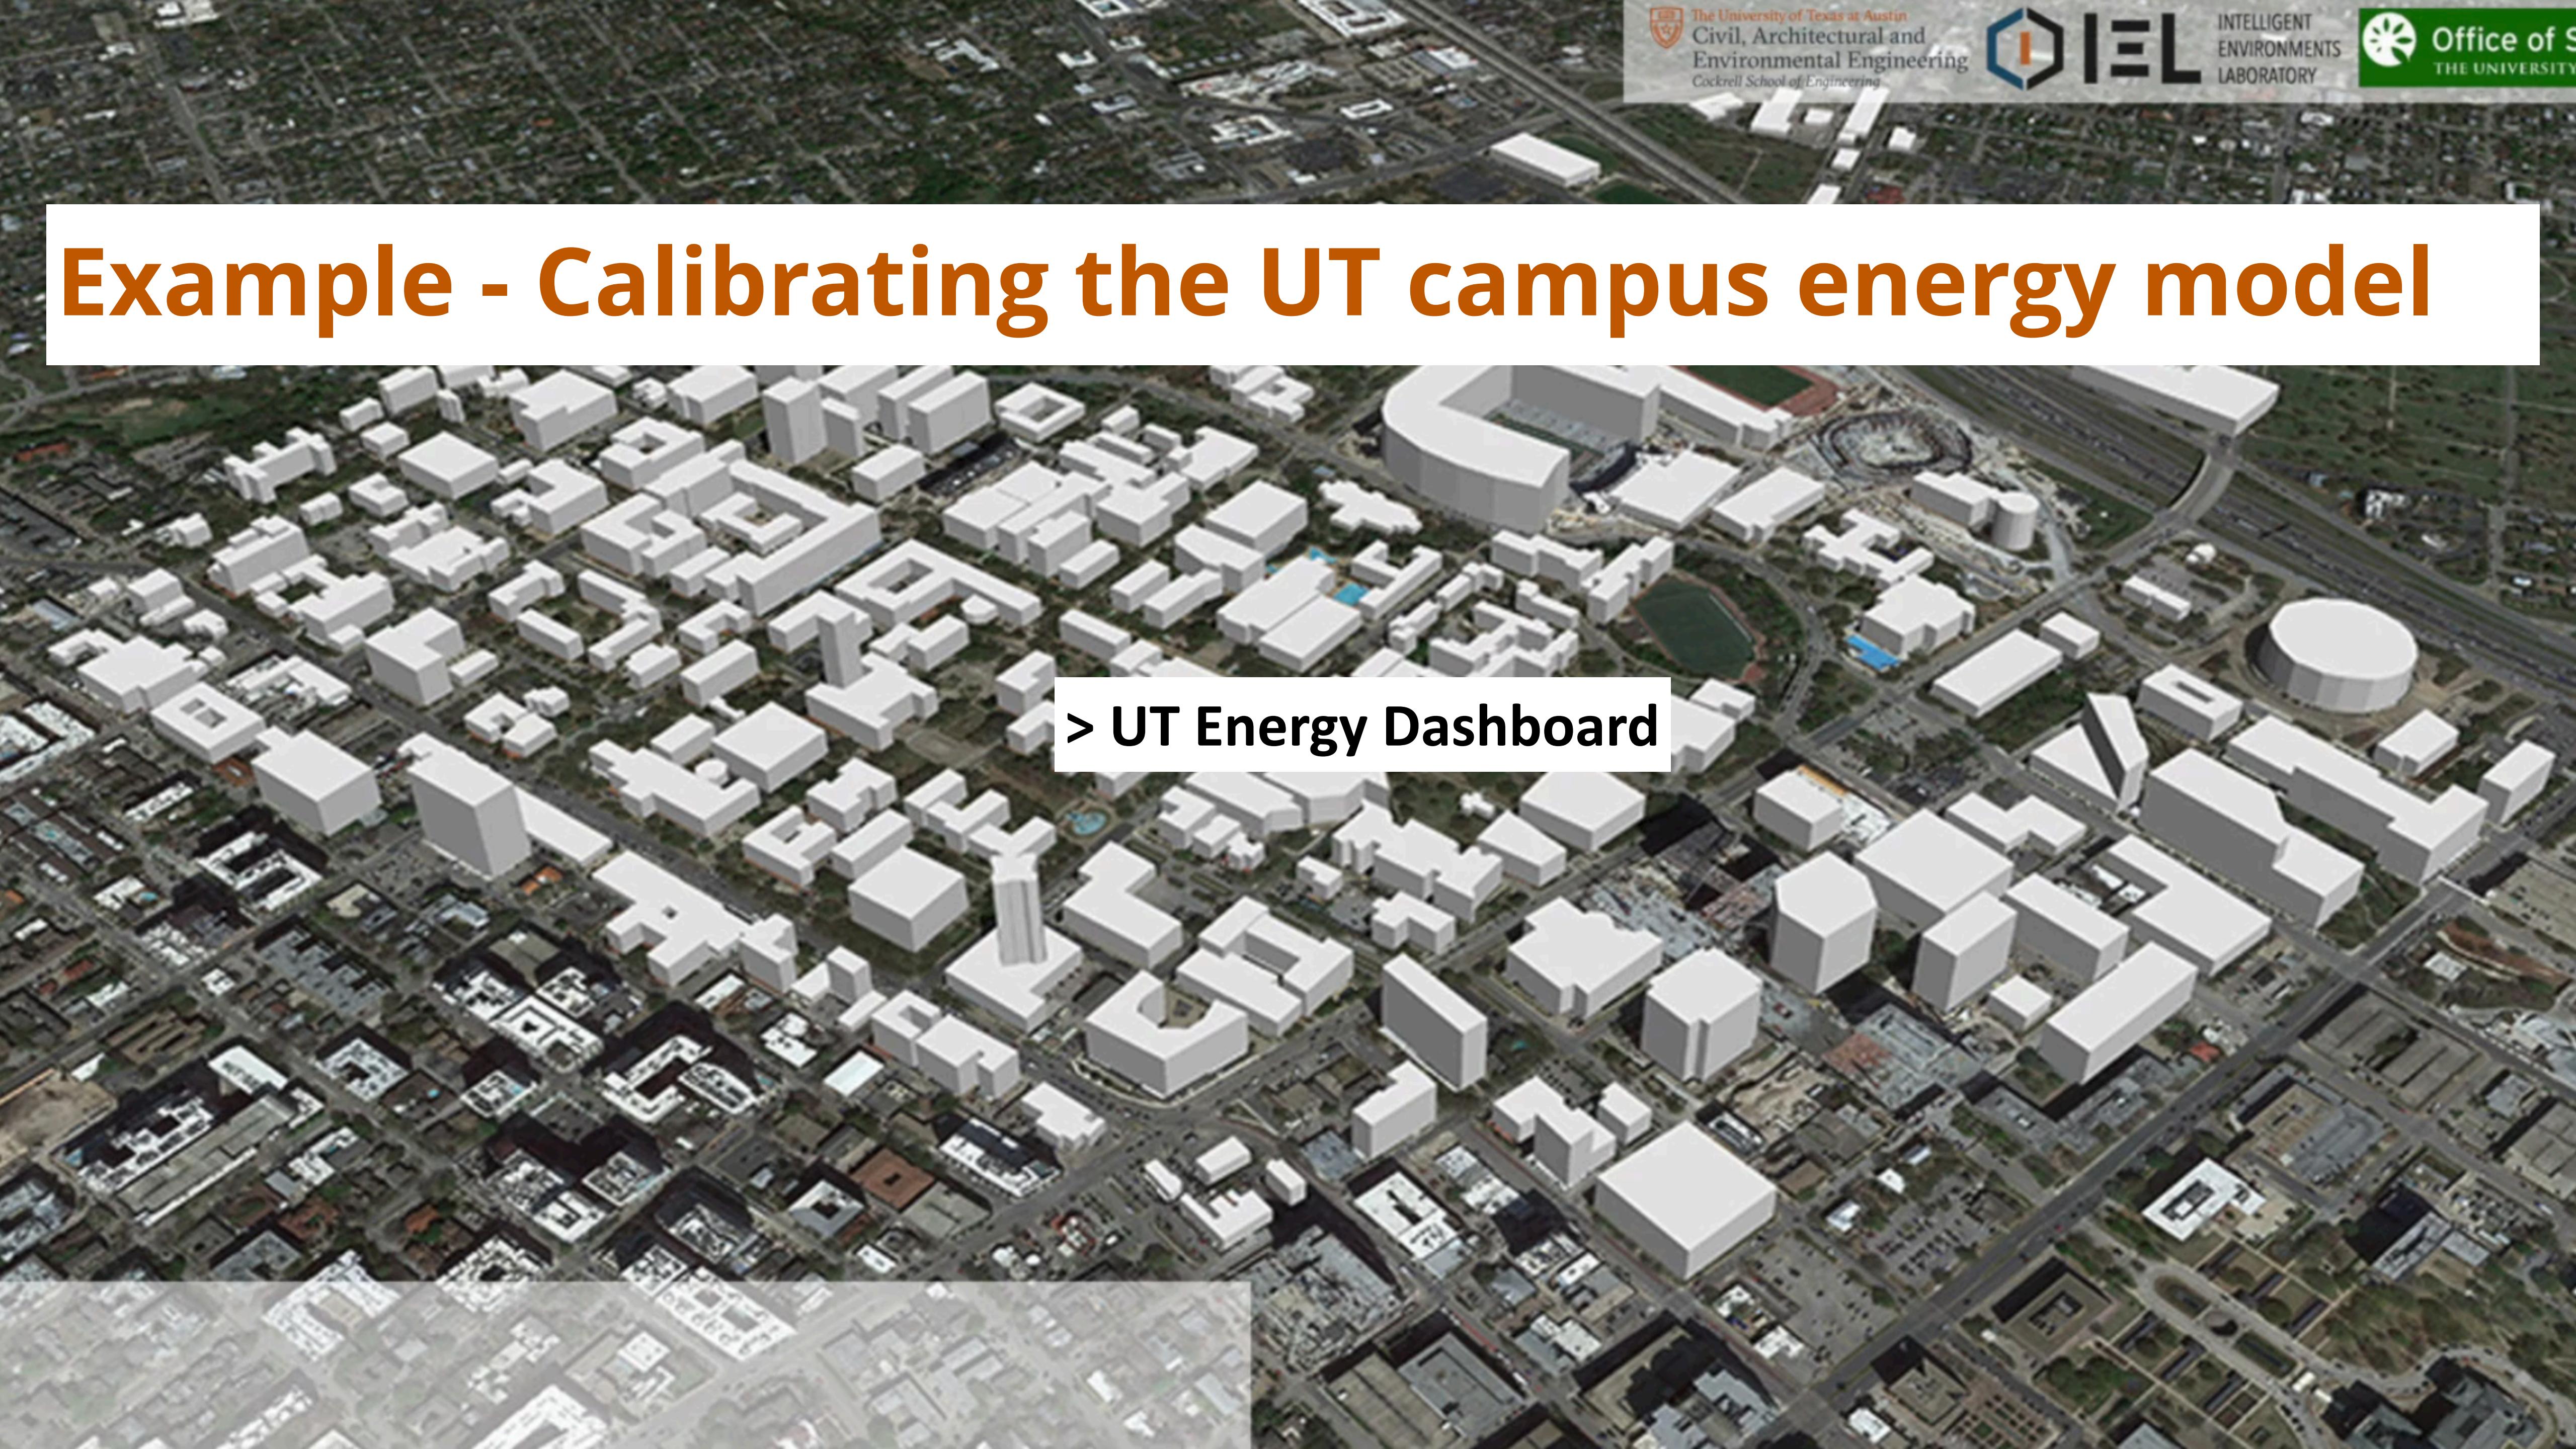

Error limits specified by various guidelines and protocols for a building energy simulation model to be deemed calibrated.

Guideline/ Protocol	Monthly Criteria (%)		Hourly Criteria (%)	
	NMBE	CV(RMSE)	NMBE	CV(RMSE)
ASHRAE Guideline 14 [59]	±5	15	±10	30
IPMVP [60]	-	-	±5	20
FEMP [61]	±5	15	±10	30
